

## 1 Introduction

### 1.1 Features

- **Highest-Performance Fixed-Point Digital Signal Processors (DSPs)**
  - 2-ns Instruction Cycle Time
  - 500-MHz Clock Rate
  - Eight 32-Bit Instructions/Cycle
  - 28 Operations/Cycle
  - 4000 MIPS
  - Fully Software Compatible With C62x™
  - C6414/15/16 Devices Pin Compatible
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very Long Instruction Word (VLIW) TMS320C64x™ DSP Core**
  - Eight Highly Independent Functional Units With VelociTI.2 Extensions With Six ALUs and Two Multipliers
  - Nonaligned Load-Store Architecture
  - 64 32-Bit General-Purpose Registers
  - Instruction Packing Reduces Code Size
  - All Instructions Conditional
- **Instruction Set Features**
  - Byte-Addressable (8-/16-/32-/64-Bit Data)
  - 8-Bit Overflow Protection
  - Bit-Field Extract, Set, Clear
  - Normalization, Saturation, Bit Counting
  - VelociTI.2 Increased Orthogonality
- **Viterbi Decoder Coprocessor (VCP) (C6416)**
  - Supports Over 500 7.95-Kbps Adaptive Multi-Rate (AMR)
  - Programmable Code Parameters
- **Turbo Decoder Coprocessor (TCP) (C6416)**
  - Supports up to Six 2-Mbps 3GPP (Six Iterations)
  - Programmable Turbo Code and Decoding Parameters
- **L1/L2 Memory Architecture**
  - 128K-Bit (16K-Byte) L1P Program Cache
  - 128K-Bit (16K-Byte) L1D Data Cache
  - 8M-Bit (1024K-Byte) L2 Unified Mapped RAM/Cache
- **Two External Memory Interfaces (EMIFs) for**
  - 1280M-Byte Addressable External Memory**
- **Enhanced Direct Memory Access (EDMA) Controller (64 Independent Channels)**
- **Host-Port Interface (HPI)**
  - User-Configurable Bus Width (32/16 Bit)
- **32-Bit/33-MHz, 3.3-V PCI Master/Slave Interface Conforms to PCI Specification 2.2 (C6415/C6416)**
  - Three PCI Bus Address Registers
  - Four-Wire Serial EEPROM Interface
  - PCI Interrupt Request Under DSP Program Control
  - DSP Interrupt Via PCI I/O Cycle
- **Three Multichannel Buffered Serial Ports (McBSPs)**
  - Direct Interface to T1/E1, MVIP, and SCSA Framers
  - Up to 256 Channels Each
  - ST Bus Switching, AC97 Compatible
  - Serial Peripheral Interface (SPI) Compatible (Motorola)
- **Three 32-Bit General-Purpose Timers**
- **Universal Test and Operations Physical Layer (PHY) Interface for ATM (UTOPIA) (C6415/C6416)**
  - UTOPIA Level-2 Slave ATM Controller
  - 8-Bit Transmit and Receive Operations up to 50 MHz per Direction
  - User-Defined Cell Format up to 64 Bytes
- **16 General-Purpose I/O (GPIO) Pins**
- **Flexible Phase-Locked Loop (PLL) Clock Generator**
- **IEEE Std 1149.1 (JTAG<sup>(1)</sup>) Boundary Scan Compatible**
- **532-Pin Ball Grid Array (BGA) Package (GLZ Suffix), 0.8-mm Ball Pitch**
- **0.13-μm/6-Level Metal Process (CMOS)**
- **3.3-V I/Os, 1.25-V Internal (500 MHz)**

(1) IEEE Std 1149.1-1990 Standard Test-Access Port and Boundary Scan Architecture

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this document.

## 1.2 SUPPORTS DEFENSE, AEROSPACE, AND MEDICAL APPLICATIONS

- **Controlled Baseline**
  - **One Assembly/Test Site**
  - **One Fabrication Site**
  - **Available in A-Version (–40°C/105°C) and S-Version (–55°C/105°C) Temperature**
- Ranges<sup>(2)</sup>**
- **Extended Product Life Cycle**
  - **Extended Product-Change Notification**
  - **Product Traceability**
- (2) S-Version currently available for C6415 only. Additional custom temperature ranges available upon request.

## 1.3 Description

The TMS320C64x™ DSPs (including the SM320C6414-EP, SM320C6415-EP, and SM320C6416-EP devices) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The SM320C64x™ (C64x™) device is based on the second-generation, high-performance, advanced VelociTI™ very-long-instruction word (VLIW) architecture (VelociTI.2™) developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunctional applications. The C64x™ is a code-compatible member of the C6000™ DSP platform.

With performance of up to 4000 million instructions per second (MIPS) at a clock rate of 500 MHz, the C64x devices offer cost-effective solutions to high-performance DSP programming challenges. The C64x DSPs possess the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units – 2 multipliers for a 32-bit result and 6 arithmetic logic units (ALUs) – with VelociTI.2 extensions. The VelociTI.2 extensions in the eight functional units include new instructions to accelerate the performance in key applications and extend the parallelism of the VelociTI architecture. The C64x can produce four 32-bit multiply-accumulates (MACs) per cycle for a total of 2400 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 4800 MMACS. The C64x DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000 DSP platform devices.

The C6416 device has two high-performance embedded coprocessors [Viterbi decoder coprocessor (VCP) and turbo decoder coprocessor (TCP)] that significantly speed up channel-decoding operations on chip. The VCP operating at CPU clock divided-by-4 can decode over 500 7.95-Kbps adaptive multi-rate (AMR) (K = 9, R = 1/3) voice channels. The VCP supports constraint lengths K = 5, 6, 7, 8, and 9, rates R = 1/2, 1/3, and 1/4, and flexible polynomials, while generating hard decisions or soft decisions. The TCP operating at CPU clock divided-by-2 can decode up to 36 384-Kbps or 6 2-Mbps turbo encoded channels (assuming iterations). The TCP implements the max\*log-map algorithm and is designed to support all polynomials and rates required by Third-Generation Partnership Projects (3GPP and 3GPP2), with fully programmable frame length and turbo interleaver. Decoding parameters, such as the number of iterations and stopping criteria, are also programmable. Communications between the VCP/TCP and the CPU are carried out through the EDMA controller.

The C64x uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The level 1 program (L1P) cache is a 128K-bit direct-mapped cache and the level 1 data (L1D) cache is a 128K-bit 2-way set-associative cache. The level 2 memory/cache (L2) consists of an 8M-bit memory space that is shared between program and data space. L2 memory can be configured as mapped memory or combinations of cache (up to 256K bytes) and mapped memory. The peripheral set includes 3 multichannel buffered serial ports (McBSPs), an 8-bit universal test and operations PHY interface for asynchronous transfer mode (ATM) slave (UTOPIA slave) port (C6415/C6416 only), 3 32-bit general-purpose timers, a user-configurable 16-bit or 32-bit host-port interface (HPI16/HPI32), a peripheral component interconnect (PCI) (C6415/C6416 only), a general-purpose input/output port (GPIO) with 16 GPIO pins, and two glueless external memory interfaces (64-bit EMIFA and 16-bit EMIFB), both of which are capable of interfacing to synchronous and asynchronous memories and peripherals.

The C64x has a complete set of development tools that includes an advanced C compiler with C64x-specific enhancements, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.<sup>(3)(4)</sup>

- (3) Throughout the remainder of this document, the SM320C6414-EP, SM320C6415-EP, and SM320C6416-EP are referred to as SM320C64x or C64x where generic and, where specific, their individual full device part numbers are used or abbreviated as C6414, C6415, or C6416, respectively.
- (4) These C64x devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

## 1.4 Ball-Grid Array (BGA) Package

**GLZ 532-PIN BALL GRID ARRAY (BGA) PACKAGE

(1) On these C64x devices, the rated EMIF speed affects only the SDRAM interface on EMIFA. For more detailed information, see the EMIF Device Speed section of this data manual.

## 1.4.2 Device Compatibility

The C64x generation of devices has a diverse and powerful set of peripherals. The common peripheral set and pin compatibility that the C6414, C6415, and C6416 devices offer lead to easier system designs and faster time to market. [Table 1-2](#) identifies the peripherals and coprocessors that are available on the C6414, C6415, and C6416 devices.

The C6414, C6415, and C6416 devices are pin-for-pin compatible, provided the following conditions are met:

- All devices use the same peripherals.
  - The C6414 is pin-for-pin compatible with the C6415/C6416 when the PCI and UTOPIA peripherals on the C6415/C6416 are disabled.
  - The C6415 is pin-for-pin compatible with the C6416 when they are in the same peripheral selection mode. For more information on peripheral selection, see the Device Configurations section of this data manual.
- The BEA[9:7] pins are properly pulled up/down.
  - For more details on the device-specific BEA[9:7] pin configurations, see the Terminal Functions table of this data manual.

(1) — denotes peripheral/coprocessor is not available on this device.

(2) Not all peripherals pins are available at the same time. (For more details, see the Device Configuration section.)

For more detailed information on the device compatibility and similarities/differences among the C6414, C6415, and C6416 devices, see the *How To Begin Development Today With the TMS320C6414, TMS320C6415, and TMS320C6416 DSPs* application report (literature number [SPRA718](#)).

### 1.4.3 Functional Block and CPU (DSP Core) Diagram

- VCP and TCP decoder coprocessors are applicable to the C6416 device only.
- For the C6415 and C6416 devices, the UTOPIA peripheral is multiplexed with McBSP1, and the PCI peripheral is multiplexed with the HPI peripheral and the GPIO[15:9] port. For more details on the multiplexed pins of these peripherals, see the Device Configurations section of this data manual.

### 1.4.4 CPU (DSP Core) Description

The CPU fetches VelociTI advanced very-long instruction words (VLIWs) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C64x CPUs from other VLIW architectures. The C64x VelociTI.2 extensions add enhancements to the TMS320C62x™ DSP VelociTI architecture. These enhancements include:

- Register file enhancements
- Data-path extensions
- Quad 8-bit and dual 16-bit extensions with data-flow enhancements
- Additional functional unit hardware
- Increased orthogonality of the instruction set
- Additional instructions that reduce code size and increase register flexibility

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1. The other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 32 32-bit registers for a total of 64 general-purpose registers. In addition to supporting the packed 16-bit and 32-/40-bit fixed-point data types found in the C62x VelociTI VLIW architecture, the C64x register files also support packed 8-bit data and 64-bit fixed-point data types. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional block and CPU (DSP core) diagram, and [Figure 1-1](#)]. The four functional units on each side of the CPU can freely share the 32 registers belonging to that side. Additionally, each side features a data cross path – a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. The C64x CPU pipelines data-cross-path accesses over multiple clock cycles. This allows the same register to be used as a data-cross-path operand by multiple functional units in the same execute packet. All functional units in the C64x CPU can access operands via the data cross path. Register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle. On the C64x CPU, a delay clock is introduced when an instruction attempts to read a register via a data cross path if that register was updated in the previous clock cycle.

In addition to the C62x DSP fixed-point instructions, the C64x DSP includes a comprehensive collection of quad 8-bit and dual 16-bit instruction set extensions. These VelociTI.2 extensions allow the C64x CPU to operate directly on packed data to streamline data flow and increase instruction set efficiency.

Another key feature of the C64x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C64x .D units can load and store bytes (8 bits), half words (16 bits), and words (32 bits) with a single instruction. And with the new data-path extensions, the C64x .D unit can load and store doublewords (64 bits) with a single instruction. Furthermore, the nonaligned load and store instructions allow the .D units to access words and doublewords on any byte boundary. The C64x CPU supports a variety of indirect addressing modes using either linear or circular addressing with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 64 registers. Some registers, however, are singled out to support specific addressing modes or to hold the condition for conditional instructions (if the condition is not automatically true).

The two .M functional units perform all multiplication operations. Each of the C64x .M units can perform two 16-bit  $\times$  16-bit multiplies or four 8-bit  $\times$  8-bit multiplies per clock cycle. The .M unit can also perform 16-bit  $\times$  32-bit multiply operations, dual 16-bit  $\times$  16-bit multiplies with add/subtract operations, and quad 8-bit  $\times$  8-bit multiplies with add operations. In addition to standard multiplies, the C64x .M units include bit-count, rotate, Galois field multiplies, and bidirectional variable shift hardware.

The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions, with results available every clock cycle. The arithmetic and logical functions on the C64x CPU include single 32-bit, dual 16-bit, and quad 8-bit operations.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are linked together by "1" bits in the least significant bit (LSB) position of the instructions. The instructions that are chained together for simultaneous execution (up to eight in total) compose an execute packet. A "0" in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. A C64x DSP device enhancement now allows execute packets to cross fetch-packet boundaries. In the TMS320C62x/TMS320C67x™ DSP devices, if an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with no-operation (NOP) instructions. In the C64x DSP device, the execute boundary restrictions have been removed, thereby, eliminating all of the NOPs added to pad the fetch packet and, thus, decreasing the overall code size. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle, and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes, halfwords, words, or doublewords. All load and store instructions are byte, halfword, word, or doubleword addressable.

For more details on the C64x CPU functional units enhancements, see the following documents:

- *TMS320C6000 CPU and Instruction Set Reference Guide* ([literature number SPRU189](#))
- *TMS320C64x™ Technical Overview* ([literature number SPRU395](#))
- *How to Begin Development Today With the TMS320C6414, TMS320C6415, and TMS320C6416 DSPs* application report ([literature number SPRA718](#))

A. For the .M functional units, the long dst is 32 MSBs and the dst is 32 LSBs.

## 1.4.5 Memory Map Summary

**Table 1-3** shows the memory map address ranges of the SM320C64x device. Internal memory is always located at address 0 and can be used as both program and data memory. The external memory address ranges in the C64x device begin at the hex address locations 0x6000 0000 for EMIFB and 0x8000 0000 for EMIFA.

**Table 1-3. SM320C64x Memory Map Summary**

| MEMORY BLOCK DESCRIPTION                               | BLOCK SIZE (BYTES) | HEX ADDRESS RANGE   |
|--------------------------------------------------------|--------------------|---------------------|
| Internal RAM (L2)                                      | 1M                 | 0000 0000–000F FFFF |
| Reserved                                               | 23M                | 0010 0000–017F FFFF |
| External Memory Interface A (EMIFA) Registers          | 256K               | 0180 0000–0183 FFFF |
| L2 Registers                                           | 256K               | 0184 0000–0187 FFFF |
| HPI Registers                                          | 256K               | 0188 0000–018B FFFF |
| McBSP 0 Registers                                      | 256K               | 018C 0000–018F FFFF |
| McBSP 1 Registers                                      | 256K               | 0190 0000–0193 FFFF |

(1) For the C6414 device, these memory address locations are reserved. The C6414 device does not support the UTOPIA and PCI peripherals.

(2) Only the C6416 device supports the VCP/TCP coprocessors. For the C6414 and C6415 devices, these memory address locations are reserved.

## 1.4.6 Peripheral Register Descriptions

Table 1-4 through Table 1-24 identify the peripheral registers for the C6414, C6415, and C6416 devices by their register names, acronyms, and hex address or hex address range. For more detailed information on the register contents and bit names and their descriptions, see the *TMS320C6000 Peripherals Reference Guide* (literature number [SPRU190](#)).

**Table 1-4. EMIFA Registers**

| HEX ADDRESS         | ACRONYM | REGISTER NAME                            |
|---------------------|---------|------------------------------------------|
| 0180 0000           | GBLCTL  | EMIFA Global Control                     |
| 0180 0004           | CECTL1  | EMIFA CE1 Space Control                  |

### 1.4.7 EDMA Channel Synchronization Events

The C64x EDMA supports up to 64 EDMA channels that service peripheral devices and external memory. [Table 1-25](#) lists the source of C64x EDMA synchronization events associated with each of the programmable EDMA channels. For the C64x device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ERL, ERH), even if the events are disabled by the EDMA event enable registers (EERL, EERH). The priority of each event can be specified independently in the transfer parameters stored in the EDMA parameter RAM. For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the EDMA Controller chapter of the *TMS320C6000 Peripherals Reference Guide* (literature number [SPRU190](#)).

**Table 1-25. SM320C64x EDMA Channel Synchronization Events<sup>(1)</sup>**

| EDMA CHANNEL | EVENT NAME      | EVENT DESCRIPTION                                                                          |
|--------------|-----------------|--------------------------------------------------------------------------------------------|
| 0            | DSP_INT         | HPI/PCI-to-DSP interrupt (PCI peripheral supported on C6415 and C6416 only) <sup>(2)</sup> |
| 1            | TINT0           | Timer 0 interrupt                                                                          |
| 2            | TINT1           | Timer 1 interrupt                                                                          |
| 3            | SD_INTA         | EMIFA SDRAM timer interrupt                                                                |
| 4            | GPINT4/EXT_INT4 | GPIO event 4/External interrupt pin 4                                                      |
| 5            | GPINT5/EXT_INT5 | GPIO event 5/External interrupt pin 5                                                      |

| 20           | SD_INTB         | EMIFB SDRAM timer interrupt                                                                |
| 21           | –               | Reserved, for future expansion                                                             |
| 22–27        | –               | None                                                                                       |
| 28           | VCPREVT         | VCP receive event (C6416 only) <sup>(3)</sup>                                              |

(1) In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the EDMA Controller chapter of the *TMS320C6000 Peripherals Reference Guide* ([SPRU190](#)).

(2) The PCI and UTOPIA peripherals are not supported on the C6414 device; therefore, these EDMA synchronization events are reserved.

(3) The VCP/TCP EDMA synchronization events are supported on the C6416 only. For the C6414 and C6415 devices, these events are reserved.

**Table 1-25. SM320C64x EDMA Channel Synchronization Events (continued)**

| EDMA CHANNEL | EVENT NAME | EVENT DESCRIPTION                                           |
|--------------|------------|-------------------------------------------------------------|

### 1.4.8 Interrupt Sources and Interrupt Selector

The C64x DSP core supports 16 prioritized interrupts, which are listed in [Table 1-26](#). The highest-priority interrupt is INT\_00 (dedicated to RESET), while the lowest-priority interrupt is INT\_15. The first four interrupts (INT\_00–INT\_03) are nonmaskable and fixed. The remaining interrupts (INT\_04–INT\_15) are maskable and default to the interrupt source specified in [Table 1-26](#). The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the interrupt selector control registers; MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

**Table 1-26. C64x DSP Interrupts**

| CPU<br>INTERRUPT<br>NUMBER | INTERRUPT<br>SELECTOR<br>CONTROL<br>REGISTER | SELECTOR<br>VALUE<br>(BINARY) | INTERRUPT<br>EVENT | INTERRUPT SOURCE                                                 |
|----------------------------|----------------------------------------------|-------------------------------|--------------------|------------------------------------------------------------------|
| INT_00 <sup>(1)</sup>      | –                                            | –                             | RESET              |                                                                  |
| INT_01 <sup>(1)</sup>      | –                                            | –                             | NMI                |                                                                  |
| INT_02 <sup>(1)</sup>      | –                                            | –                             | Reserved           | Reserved. Do not use.                                            |
| INT_03 <sup>(1)</sup>      | –                                            | –                             | Reserved           | GPIO interrupt 4/external interrupt 4                            |

| –                          | –                                            | 10111                         | UINT               | UTOPIA interrupt (C6415/C6416 only)                              |
| –                          | –                                            | 11000–11101                   | Reserved           | Reserved. Do not use.                                            |
| –                          | –                                            | 11110                         | VCPINT             | VCP interrupt (C6416 only)                                       |
| –                          | –                                            | 11111                         | TCPINT             | TCP interrupt (C6416 only)                                       |

(1) Interrupts INT\_00–INT\_03 are nonmaskable and fixed.

(2) Interrupts INT\_04–INT\_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. [Table 1-26](#) shows the default interrupt sources for interrupts INT\_04–INT\_15. For more detailed information on interrupt sources and selection, see the Interrupt Selector and External Interrupts chapter of the *TMS320C6000 Peripherals Reference Guide* ([SPRU190](#)).

### 1.4.9 Signal Groups Description

† These pins are MUXed with the GPIO port pins and by default these signals function as clocks (CLKOUT4 or CLKOUT6) or McBSP2 clock source (CLKS2). To use these MUXed pins as GPIO signals, the appropriate GPIO register bits (GPxEN and GPxDIR) must be properly enabled and configured. For more details, see the Device Configurations section of this data sheet.

‡ These pins are GPIO pins that can also function as external interrupt sources (EXT\_INT[7:4]). Default after reset is EXT\_INTx or GPIO as input-only.

§ For the C6415 and C6416 devices, these GPIO pins are MUXed with the PCI peripheral pins. By default, these signals are set up to no function with both the GPIO and PCI pin functions *disabled*. For more details on these MUXed pins, see the Device Configurations section of this data sheet. For the C6414 device, the GPIO peripheral pins are *not* MUXed; the C6414 device does *not* support the PCI peripheral.

### Figure 1-2. CPU and Peripheral Signals

† These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

Figure 1-3. Peripheral Signals (1)

<sup>†</sup> For the C6415 and C6416 devices, these HPI pins are MUXed with the PCI peripheral. By default, these signals function as HPI. For more details on these MUXed pins, see the Device Configurations section of this data sheet. For the C6414 device, these HPI pins are *not* MUXed; the C6414 device does *not* support the PCI peripheral.

<sup>‡</sup> For the C6415 and C6416 devices, these PCI pins (excluding PCBE0 and XSP\_CS) are MUXed with the HPI, McBSP2, or GPIO peripherals. By default, these signals function as HPI, McBSP2, and no function, respectively. For more details on these MUXed pins, see the Device Configurations section of this data sheet. For the C6414 device, the HPI, McBSP2, and GPIO peripheral pins are *not* MUXed; the C6414 device does *not* support the PCI peripheral.

<sup>§</sup> For the C6414 device, these pins are "Reserved (leave unconnected, *do not* connect to power or ground)."

Figure 1-4. Peripheral Signals (2)

<sup>†</sup> For the C6415 and C6416 devices, these McBSP2 and McBSP1 pins are MUXed with the PCI and UTOPIA peripherals, respectively. By default, these signals function as McBSP2 and McBSP1, respectively. For more details on these MUXed pins, see the Device Configurations section of this data sheet.  
For the C6414 device, these McBSP2 and McBSP1 peripheral pins are *not* MUXed; the C6414 device does *not* support PCI and UTOPIA peripherals.

<sup>‡</sup> The McBSP2 clock source pin (CLKS2, default) is MUXed with the GP8 pin. To use this MUXed pin as the GP8 signal, the appropriate GPIO register bits (GP8EN and GP8DIR) must be properly enabled and configured. For more details, see the Device Configurations section of this data sheet.

**Figure 1-5. Peripheral Signals (3)**

<sup>†</sup> For the C6415 and C6416 devices, these UTOPIA pins are MUXed with the McBSP1 peripheral. By default, these signals function as McBSP1. For more details on these MUXed pins, see the Device Configurations section of this data sheet.  
For the C6414 device, these McBSP1 peripheral pins are *not* MUXed; the C6414 does *not* support the UTOPIA peripheral.

## 2 Device Configurations

The C6414, C6415, and C6416 peripheral selections and other device configurations are determined by external pullup/pulldown resistors on the following pins (all of which are latched during device reset):

- Peripherals selection (C6415 and C6416 devices)
  - BEA11 (UTOPIA\_EN)
  - PCI\_EN (for C6415 or C6416, see Table 28 footnotes)
  - MCBSP2\_EN (for C6414 or C6416, see Table 28 footnotes)

The C6414 device does not support the PCI and UTOPIA peripherals; for proper operation of the C6414 device, do not oppose the internal pulldowns (IPDs) on the BEA11, PCI\_EN, and MCBSP2\_EN pins. (For IPU/IPDs on pins, see the Terminal Functions table of this data manual.)

- Other device configurations (C64x)
  - BEA[20:13, 7]
  - HD5

### 2.1 Peripherals Selection

Some C6415/C6416 peripherals share the same pins (internally multiplexed) and are mutually exclusive (i.e., HPI, GPIO pins GP[15:9], PCI and its internal EEPROM, McBSP1, McBSP2, and UTOPIA). The VCP/TCP coprocessors (C6416 only) and other C64x peripherals (i.e., the timers, McBSP0, and the GP[8:0] pins) are always available.

- UTOPIA and McBSP1 peripherals

The UTOPIA\_EN pin (BEA11) is latched at reset. For C6415 and C6416 devices, this pin selects whether the UTOPIA peripheral or McBSP1 peripheral is functionally enabled (see [Table 2-1](#)).

The C6414 device does not support the UTOPIA peripheral; for proper device operation, do not oppose the internal pulldown (IPD) on the BEA11 pin.

**Table 2-1. UTOPIA\_EN Peripheral Selection (McBSP1 and UTOPIA) (C6415/C6416 Only)**

| PERIPHERAL SELECTION<br>UTOPIA_EN<br>(BEA11) PIN [D16] | PERIPHERALS SELECTED |        | DESCRIPTION                                                                                                                                                                     |
|--------------------------------------------------------|----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                        | UTOPIA               | McBSP1 |                                                                                                                                                                                 |
| 0                                                      |                      | √      | McBSP1 is enabled and UTOPIA is disabled (default). This means all multiplexed McBSP1/UTOPIA pins function as McBSP1 and all other stand alone UTOPIA pins are tied off (Hi-Z). |
| 1                                                      | √                    |        | UTOPIA is enabled and McBSP1 is disabled. This means all multiplexed McBSP1/UTOPIA pins now function as UTOPIA and all other stand alone McBSP1 pins are tied off (Hi-Z).       |

- HPI, GP[15:9], PCI, EEPROM (internal to PCI), and McBSP2 peripherals

The PCI\_EN and MCBSP2\_EN pins are latched at reset. They determine specific peripheral selection for the C6415 and C6416 devices, summarized in [Table 2-2](#).

The C6414 device does not support the PCI peripheral; for proper device operation, do not oppose the internal pulldowns (IPDs) on the PCI\_EN and MCBSP2\_EN pins.

**Table 2-2. PCI\_EN and MCBSP2\_EN Peripheral Selection (HPI, GP[15:9], PCI, and McBSP2)**

| PERIPHERAL SELECTION <sup>(1)</sup> |                        | PERIPHERALS SELECTED |          |     |                             |        |
|-------------------------------------|------------------------|----------------------|----------|-----|-----------------------------|--------|
| PCI_EN<br>PIN [AA4]                 | MCBSP2_EN<br>PIN [AF3] | HPI                  | GP[15:9] | PCI | EEPROM<br>(INTERNAL TO PCI) | McBSP2 |
| 0                                   | 0                      | √                    | √        |     |                             | √      |
| 0                                   | 1                      | √                    | √        |     |                             | √      |

(1) The PCI\_EN pin must be driven valid at all times and the user must not switch values throughout device operation. The MCBSP2\_EN pin must be driven valid at all times and the user can switch values throughout device operation.

**Table 2-2. PCI\_EN and MCBSP2\_EN Peripheral Selection (HPI, GP[15:9], PCI, and McBSP2) (continued)**

| PERIPHERAL SELECTION <sup>(1)</sup> |                        | PERIPHERALS SELECTED |          |     |                             |        |
|-------------------------------------|------------------------|----------------------|----------|-----|-----------------------------|--------|
| PCI_EN<br>PIN [AA4]                 | MCBSP2_EN<br>PIN [AF3] | HPI                  | GP[15:9] | PCI | EEPROM<br>(INTERNAL TO PCI) | McBSP2 |
| 1                                   | 0                      |                      |          | √   | √                           |        |
| <sup>(2)</sup> 1                    | 1                      |                      |          | √   |                             | √      |

(2) The only time McBSP2 is disabled is when both PCI\_EN = 1 and MCBSP2\_EN = 0. This configuration enables, at reset, the auto-initialization of the PCI peripheral through the PCI internal EEPROM [provided the PCI EEPROM auto-initialization pin (BEA13) is pulled up (EEAI = 1)]. The user then can enable the McBSP2 peripheral (disabling EEPROM) by dynamically changing MCBSP2\_EN to a 1 after the device is initialized (out of reset).

- If the PCI is disabled (PCI\_EN = 0), the HPI peripheral is enabled and GP[15:9] pins can be programmed as GPIO, provided the GPxEN and GPxDIR bits are properly configured.  
This means all multiplexed HPI/PCI pins function as HPI and all stand-alone PCI pins (PCBE0 and XSP\_CS) are tied off (Hi-Z). Also, the multiplexed GPIO/PCI pins can be used as GPIO with the proper software configuration of the GPIO Enable and Direction registers (for more details, see [Table 2-4](#)).
- If the PCI is enabled (PCI\_EN = 1), the HPI peripheral is disabled.  
This means all multiplexed HPI/PCI pins function as PCI. Also, the multiplexed GPIO/PCI pins function as PCI pins (for more details, see [Table 2-4](#)).
- The MCBSP2\_EN pin, in combination with the PCI\_EN pin, controls the selection of the McBSP2 peripheral and the PCI internal EEPROM (for more details, see [Table 2-2](#) and its footnotes).

## 2.2 Other Device Configurations

[Table 2-3](#) describes the C6414, C6415, and C6416 devices configuration pins, which are set up via external pullup/pulldown resistors through the specified EMIFB address bus pins (BEA[20:13, 11, 9:7]) and the HD5 pin. For more details on these device configuration pins, see the Terminal Functions table and the Debugging Considerations section.

**Table 2-3. Device Configuration Pins (BEA[20:13, 9:7], HD5, and BEA11)**

| CONFIGURATION PIN    | NO.               | FUNCTIONAL DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                         |                                                                                             |

(1) For proper device operation, this pin must be externally pulled up with a 1-kΩ resistor.

## 2.3 Multiplexed Pins

Multiplexed pins are pins that are shared by more than one peripheral and are internally multiplexed. Some of these pins are configured by software, and the others are configured by external pullup/pulldown resistors only at reset. The multiplexed pins that are configured by software can be programmed to switch functionalities at any time. The multiplexed pins that are configured by external pullup/pulldown resistors are mutually exclusive; only one peripheral has primary control of the function of these pins after reset. [Table 2-4](#) identifies the multiplexed pins on the C6414, C6415, and C6416 devices, shows the default (primary) function and the default settings after reset, and describes the pins, registers, etc., necessary to configure specific multiplexed functions.

## 2.4 Debugging Considerations

It is recommended that external connections be provided to device configuration pins, including CLKMODE[1:0], BEA[20:13, 11, 9:7], HD5/AD5, PCI\_EN, and MCBSP2\_EN. Although internal pullup/pulldown resistors exist on these pins (except for HD5/AD5), providing external connectivity adds convenience to the user in debugging and flexibility in switching operating modes.

Internal pullup/pulldown resistors also exist on the nonconfiguration pins on the BEA bus (BEA[12, 10, 6:1]). Do not oppose the internal pullup/pulldown resistors on these nonconfiguration pins with external pullup/pulldown resistors. If an external controller provides signals to these nonconfiguration pins, these signals must be driven to the default state of the pins at reset or not be driven at all.

For the internal pullup/pulldown resistors on the C6414, C6415, and C6416 device pins, see the Terminal Functions table.

(1) For the C6415 and C6416 devices, all other stand-alone UTOPIA and PCI pins are tied off internally (pins in Hi-Z) when the peripheral is disabled [UTOPIA\_EN (BEA11) = 0 or PCI\_EN = 0].

(2) The C6414 device does not support the PCI and UTOPIA peripherals. These are the only multiplexed pins on the C6414 device, all other pins are stand-alone peripheral functions and are not multiplexed.

**Table 2-4. C6414, C6415, and C6416 Device Multiplexed Pins (continued)**

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

(2) IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

(3) These pins are multiplexed pins. For more details, see the Device Configurations section of this data manual.

(4) PLLV is not part of external voltage supply. See the Clock PLL section for information on how to connect this pin.

(5) A = Analog signal (PLL filter)

| GP7/EXT_INT7                                                                                                     | AF4 | I/O/Z               | IPU                    | General-purpose input/outputs (GPIO) (I/O/Z) or external interrupts (input only). The default after reset setting is GPIO enabled as input only. When these pins function as external interrupts [by selecting the corresponding interrupt enable register bit (IER.[7:4])], they are edge driven and the polarity can be independently selected via the External Interrupt Polarity Register bits (EXTPOL[3:0]).                                             |

(6) For the C6415 and C6416 devices, these pins are multiplexed pins. For more details, see the Device Configurations section of this data manual. The C6414 device does not support the PCI or UTOPIA peripherals; therefore, these MUXed peripheral pins are stand alone peripheral functions for this device.

(7) For the C6414 device, only these pins are multiplexed pins.

The EMIFA input clock (AECLKIN, CPU/4 clock, or CPU/6 clock) is selected at reset via the pullup/pulldown resistors on the BEA[17:16] pins. AECLKIN is the default for the EMIFA input clock.                                                                                                                                                                                                                                                     |

(8) These C64x devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

(9) To maintain signal integrity for the EMIF signals, serial termination resistors should be inserted into all EMIF output signal lines.

### 3 Development Support

TI offers an extensive line of development tools for the TMS320C6000. DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000. DSP-based applications:

- **Software Development Tools:**
  - Code Composer Studio. Integrated Development Environment (IDE) including Editor
  - C/C++/Assembly Code Generation, and Debug plus additional development tools
  - Scalable, Real-Time Foundation Software (DSP/BIOS.), which provides the basic run-time target software needed to support any DSP application.
- **Hardware Development Tools:**
  - Extended Development System (XDS.) Emulator (supports C6000. DSP multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000. DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

#### 3.1 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320. DSP devices and support tools. Each TMS320. DSP family member has one of three prefixes; TMX, TMP, or TMS. TI recommends two of three possible prefix designators for support tools; TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

|                                             |                                                                                                                                      |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>TMX</b>                                  | Experimental device that is not necessarily representative of the final device's electrical specifications.                          |
| <b>TMP</b>                                  | Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification |
| <b>SM</b>                                   | Fully qualified production device                                                                                                    |
| Support tool development evolutionary flow: |                                                                                                                                      |
| <b>TMDX</b>                                 | Development-support product that has not yet completed Texas Instruments internal qualification testing.                             |
| <b>TMDS</b>                                 | Fully qualified development-support product                                                                                          |

TMX and TMP devices and TMDX development-support tools are shipped with appropriate disclaimers describing their limitations and intended uses. Experimental devices (TMX) may not be representative of a final product and Texas Instruments reserves the right to change or discontinue these products without notice.

SM devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLZ), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz. [Figure 3-1](#) provides a legend for reading the complete device name for any SM320C64x. DSP generation member.

† See the Recommended Operating Conditions section of this data sheet for more details.

‡ The extended temperature "A or S version" devices may have different operating conditions than the commercial temperature devices. See the Recommended Operating Conditions section of this data sheet for more details.

§ BGA = Ball Grid Array

¶ For the actual device part numbers (P/Ns) and ordering information, see the orderable information at the end of this data sheet.

### 3.1.1 Documentation Support

Extensive documentation supports all TMS320 DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000 DSP devices.

The *TMS320C6000 CPU and Instruction Set Reference Guide* ([SPRU189](#)) describes the C6000E DSP CPU (core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 Peripherals Reference Guide* ([SPRU190](#)) describes the functionality of the peripherals available on the C6000E DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), direct-memory-access (DMA), enhanced direct-memory-access (EDMA) controller, multichannel buffered serial ports (McBSPs), an 8-bit Universal Test and Operations PHY Interface for ATM Slave (UTOPIA Slave) port, 32-/16-bit host-port interfaces (HPis), a peripheral component interconnect (PCI), expansion bus (XB), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); general-purpose timers, general-purpose input/output (GPIO) port, and power-down modes. This guide also includes information on internal data and program memories.

The *TMS320C6000 Technical Brief* ([SPRU197](#)) gives an introduction to the TMS320C62xE/ TMS320C67xE devices, associated development tools, and third-party support.

The *TMS320C64x Technical Overview* ([SPRU395](#)) gives an introduction to the C64xE digital signal processor, and discusses the application areas that are enhanced by the C64xE DSP VelocityTI.2E VLIW architecture.

The *TMS320C6414, TMS320C6415, and TMS320C6416 Digital Signal Processors Silicon Errata* ([SPRZ011](#)) describes the known exceptions to the functional specifications for the TMS320C6414, TMS320C6415, and TMS320C6416 devices

The tools support documentation is electronically available within the Code Composer StudioE Integrated Development Environment (IDE). For a complete listing of C6000E DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

See the worldwide web URL for the *How to Begin Development Today With the TMS320C6414, TMS320C6415, and TMS320C6416 DSPs* application report ([SPRA718](#)), which describes in more details the compatibility and similarities/differences among the C6414, C6415, C6416, and C6211 devices.

### 3.1.2 Clock PLL

Most of the internal C64x DSP clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5 shows the external PLL circuitry for either x1 (PLL bypass) or other PLL multiply modes.

To minimize the clock jitter, a single clean power supply should power both the C64x DSP device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the input and output clocks electrical section.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the DSP requirements in this data sheet (see the electrical characteristics over recommended ranges of supply voltage and operating case temperature table and the input and output clocks electrical section). [Table 3-1](#) lists some examples of compatible CLKIN external clock sources.

**Table 3-1. Compatible CLKIN External Clock Sources**

| COMPATIBLE PARTS FOR<br>EXTERNAL CLOCK SOURCES (CLKIN) | PART NUMBER               | MANUFACTURER               |
|--------------------------------------------------------|---------------------------|----------------------------|
| Oscillators                                            | JITO-2                    | Fox Electronix             |
|                                                        | STA series, ST4100 series | SaRonix Corporation        |
|                                                        | SG-636                    | Epson America              |
|                                                        | 342                       | Corning Frequency Control  |
| PLL                                                    | ICS525-02                 | Integrated Circuit Systems |

(For the PLL Options, CLKMODE Pins Setup, and PLL Clock Frequency Ranges, see NO TAG.)

- Place all PLL external components (C1, C2, and the EMI filter) as close to the C6000 DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
- For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).
- The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.
- EMI filter manufacturer TDK part number ACF451832-333, -223, -153, -103. Panasonic part number EXCCE103U.

**Figure 3-2. External PLL Circuitry for Either PLL Multiply Modes or x1 (Bypass) Mode**

| CLKMODE1                   | CLKMODE0 | CLKMODE (PLL MULTIPLY FACTORS) | CLKIN RANGE (MHz) | CPU CLOCK FREQUENCY RANGE (MHz) | CLKOUT4 RANGE (MHz) | CLKOUT6 RANGE (MHz) | TYPICAL LOCK TIME (ms) <sup>(3)</sup> |
| 0                          | 0        | Bypass (x1)                    | 30–75             | 30–75                           | 7.5–18.8            | 5–12.5              | N/A                                   |
| 0                          | 1        | x6                             | 30–75             | 180–450                         | 45–112.5            | 30–75               | 75                                    |
| 1                          | 0        | x12                            | 30–60             | 360–720                         | 90–180              | 60–120              |                                       |
| 1                          | 1        | Reserved                       | –                 | –                               | –                   | –                   | –                                     |

- These clock frequency range values are applicable to a 600-MHz CPU, 133-MHz EMIFA speed device. For a 500-MHz CPU, 100-MHz EMIF, and 700-MHz CPU, 100 MHz EMIF device speed values, see the CLKIN timing requirements table for the specific device speed.
- Use external pullup resistors on the CLKMODE pins (CLKMODE1 and CLKMODE0) to set the C64x device to one of the valid PLL multiply clock
- Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100  $\mu$ s, the maximum value may be as long as 250  $\mu$ s.

### 3.1.3 Power-Supply Sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

### 3.1.4 Power-Supply Design Considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see [Figure 3-3](#)).

**Figure 3-3. Schottky Diode Diagram**

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000 platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

### 3.1.5 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps, 30 for the core supply and 30 for the I/O supply. These caps need to be close to the DSP, no more than 1.25-cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point of view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value. As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

### 3.1.6 IEEE 1149.1 JTAG Compatibility Statement

The TMS320C6414/15/16 DSP requires that both  $\overline{\text{TRST}}$  and  $\overline{\text{RESET}}$  be asserted upon power up to be properly initialized. While  $\overline{\text{RESET}}$  initializes the DSP core,  $\overline{\text{TRST}}$  initializes the DSP emulation logic. Both resets are required for proper operation.

While both  $\overline{\text{TRST}}$  and  $\overline{\text{RESET}}$  should be asserted upon power up, only  $\overline{\text{RESET}}$  should be released for the DSP to boot properly.  $\overline{\text{TRST}}$  may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP emulation logic in the reset state.

$\overline{\text{TRST}}$  only should be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP boundary scan functionality.

For maximum reliability, the TMS320C6414/15/16 DSP includes an internal pulldown (IPD) on the  $\overline{\text{TRST}}$  pin to ensure that  $\overline{\text{TRST}}$  is always be asserted upon power up and the DSP internal emulation logic is always properly initialized.

JTAG controllers from TI actively drive  $\overline{\text{TRST}}$  high. However, some third-party JTAG controllers may not drive  $\overline{\text{TRST}}$  high, but expect the use of a pullup resistor on  $\overline{\text{TRST}}$ .

When using this type of JTAG controller, assert  $\overline{\text{TRST}}$  to initialize the DSP after power up and externally drive  $\overline{\text{TRST}}$  high before attempting any emulation or boundary-scan operations. Following the release of  $\overline{\text{RESET}}$ , the low-to-high transition of  $\overline{\text{TRST}}$  must be seen to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either boundary scan mode or emulation mode. For more detailed information, see the terminal functions section of this data sheet.

### 3.1.7 EMIF Device Speed

The rated EMIF speed (referring to both EMIFA and EMIFB) of these devices only applies to the SDRAM interface when in a system that meets the following requirements:

- One bank (maximum of 2 chips) of SDRAM connected to EMIF
- Up to one bank of buffers connected to EMIF
- EMIF trace lengths between 1 inch and 3 inches
- 183-MHz SDRAM for 133-MHz operation (applies only to EMIFA)
- 143-MHz SDRAM for 100-MHz operation

Other configurations may be possible, but timing analysis must be done to verify all ac timings are met. Verification of ac timings is mandatory when using configurations other than those specified. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all ac timings.

To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report ([SPRA839](#)).

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

### 3.1.8 Boot Mode

The C6414/15/16 device resets using the active-low signal  $\overline{\text{RESET}}$ . While  $\overline{\text{RESET}}$  is low, the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of  $\overline{\text{RESET}}$  starts the processor running with the prescribed device configuration and boot mode.

The C6414/C6415/C6416 has three types of boot modes:

- Host boot  
If host boot is selected, upon release of  $\overline{\text{RESET}}$ , the CPU is internally "stalled", while the remainder of the device is released. During this period, an external host can initialize the CPU memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. For the C6414 device, the HPI peripheral is used for host boot. For the C6415/C6416 device, the HPI peripheral is used for host boot if  $\text{PCI\_EN} = 0$ , and the PCI peripheral is used for host boot if  $\text{PCI\_EN} = 1$ . Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the "stalled" state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally "stalled". Also, DSPINT brings the CPU out of the "stalled" state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the "stalled" state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.
- EMIF boot (using default ROM timings)  
Upon the release of  $\overline{\text{RESET}}$ , the 1K-Byte ROM code located in the beginning of  $\overline{\text{CE1}}$  is copied to

address 0 by the EDMA using the default ROM timings, while the CPU is internally "stalled". The data should be stored in the endian format that the system is using. In this case, the EMIF automatically assembles consecutive 8-bit bytes to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the "stalled" state and starts running from address 0.

- **No boot**

With no boot, the CPU begins direct execution from the memory located at address 0. If SDRAM is used in the system, the CPU is internally "stalled" until the SDRAM initialization is complete. Note: operation is undefined if invalid code is located at address 0.

## 4 Electrical Specifications

### 4.1 ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

|                       |                                                                |                            | VALUE                   | UNIT |

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to  $V_{SS}$ .

### 4.2 RECOMMENDED OPERATING CONDITIONS

|           |                                                       | MIN          | NOM  | MAX             | UNIT |
|-----------|-------------------------------------------------------|--------------|------|-----------------|------|
| $CV_{DD}$ | Supply voltage, Core (-50xEP device) <sup>(1)</sup>   | 1.19         | 1.25 | 1.31            | V    |
| $DV_{DD}$ | Supply voltage, I/O                                   | 3.14         | 3.3  | 3.46            | V    |
| $V_{SS}$  | Supply ground                                         | 0            | 0    | 0               | V    |
| $V_{IH}$  | High-level input voltage (except PCI)                 | 2            |      |                 | V    |
| $V_{IL}$  | Low-level input voltage (except PCI)                  |              |      | 0.8             | V    |
| $V_{IP}$  | Input voltage (PCI) (C6415 and C6416 only)            | –0.5         |      | $DV_{DD} + 0.5$ | V    |
| $V_{IHP}$ | High-level input voltage (PCI) (C6415 and C6416 only) | $0.5DV_{DD}$ |      | $DV_{DD} + 0.5$ | V    |
| $V_{ILP}$ | Low-level input voltage (PCI) (C6415 and C6416 only)  | –0.5         |      | $0.3DV_{DD}$    | V    |
| $T_C$     | Operating case temperature (A version)                | –40          |      | 105             | °C   |
|           | Operating case temperature (S version)                | –55          |      | 105             | °C   |

- (1) Future variants of the C641x DSPs may operate at voltages ranging from 0.9 V to 1.4 V to provide a range of system power/performance options. TI highly recommends that users design a supply that can handle multiple voltages within this range (i.e., 1.2 V, 1.25 V, 1.3 V, 1.35 V, 1.4 V with  $\pm 3\%$  tolerances) by implementing simple board changes, such as reference resistor values or input pin configuration modifications. Examples of such supplies include the PT4660, PT5500, PT5520, PT6440, and PT6930 series from Power Trends, a subsidiary of TI. Not incorporating a flexible supply may limit the system's ability to easily adapt to future versions of C641x devices.

### 4.3 ELECTRICAL CHARACTERISTICS

(2) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.

(3) PCI input leakage currents include Hi-Z output leakage for all bidirectional buffers with 3-state outputs.

(4) Measured with average activity (50% high/50% low power). The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the TMS320C6414/15/16 Power Consumption Summary application report ([SPRA811](#)).

(5) Advance information

## 5 PARAMETER MEASUREMENT INFORMATION

The load capacitance value stated is only for characterization and measurement of ac timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

Figure 5-1. AC Timing Reference Circuit for AC Timing Measurements

### 5.1 Signal Transition Levels

All input and output timing parameters are referenced to 1.5 V for both 0 and 1 logic levels.

Figure 5-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to  $V_{IL}$  MAX and  $V_{IH}$  MIN for input clocks,  $V_{OL}$  MAX and  $V_{OH}$  MIN for output clocks,  $V_{ILP}$  MAX and  $V_{IHP}$  MIN for PCI input clocks, and  $V_{OLP}$  MAX and  $V_{OHP}$  MIN for PCI output clocks.

Figure 5-3. Rise and Fall Transition Time Voltage Reference Levels

### 5.2 Signal Transition Rates

All timings are tested with an input edge rate of 4 V per nanosecond (4 V/ns).

### 5.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data sheet do *not* include delays by board routing. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see [Table 5-1](#) and [Figure 5-4](#)).

[Figure 5-4](#) represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

**Table 5-1. Board-Level Timing (see [Figure 5-4](#))**

| NO. | DESCRIPTION                            |
|-----|----------------------------------------|
| 1   | Clock route delay                      |
| 2   | Minimum DSP hold time                  |
| 3   | Minimum DSP setup time                 |
| 4   | External device hold time requirement  |
| 5   | External device setup time requirement |
| 6   | Control signal route delay             |
| 7   | External device hold time              |

Figure 5-7. CLKOUT6 Timing

### 5.1.4 Timing Requirements ECLKIN for EMIFA and EMIFB <sup>(1)</sup> <sup>(2)</sup> <sup>(3)</sup> (see [Figure 5-8](#))

| NO. | PARAMETER                                  | –50xEP           |       | UNIT |
|-----|--------------------------------------------|------------------|-------|------|
|     |                                            | MIN              | MAX   |      |
| 1   | $t_{C(EKI)}$ Cycle time, ECLKIN            | 6 <sup>(4)</sup> | 16P   | ns   |
| 2   | $t_{W(EKI H)}$ Pulse duration, ECLKIN high | 2.7              |       | ns   |
| 3   | $t_{W(EKI L)}$ Pulse duration, ECLKIN low  | 2.7              |       | ns   |
| 4   | $t_{t(EKI)}$ Transition time, ECLKIN       |                  | 2     | ns   |
| 5   | $t_{J(EKI)}$ Peak-to-Peak jitter, ECLKIN   |                  | 0.02E | ns   |

- (1) P = 1/CPU clock frequency in ns. For example, when running parts at 500 MHz, use P = 2 ns.  
(2) The reference points for the rise and fall transitions are measured at  $V_{IL}$  MAX and  $V_{IH}$  MIN.  
(3) These C64xE devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted.  
(4) Minimum ECLKIN times are based on internal logic speed; the maximum useable speed of the EMIF may be lower due to ac timing requirements. On the 7E3 and 6E3 devices, 133-MHz operation is achievable if the requirements of the EMIF Device Speed section are met. On the 5E0 devices, 100-MHz operation is achievable if the requirements of the EMIF Device Speed section are met.

**Figure 5-8. ECLKIN Timing for EMIFA and EMIFB**

| NO. | PARAMETER                                                      | –50xEP   |                 | UNIT |

| 1   | $t_{J(EKO2)}$ Cycle-to-cycle jitter, ECLKOUT2                  | 0          | $\pm 175^{(1)}$ | ns   |
| 2   | $t_{W(EKO2 H)}$ Pulse duration, ECLKOUT2 high                  | 05NE – 0.7 | 05NE + 0.7      | ns   |
| 3   | $t_{W(EKO2 L)}$ Pulse duration, ECLKOUT2 low                   | 05NE – 0.7 | 05NE + 0.7      | ns   |
| 4   | $t_{t(EKO2)}$ Transition time, ECLKOUT2                        |            | 1               | ns   |
| 5   | $t_{d(EKI H-EKO2 H)}$ Delay time, ECLKIN high to ECLKOUT2 high | 1          | 8               | ns   |
| 6   | $t_{d(EKI L-EKO2 L)}$ Delay time, ECLKIN low to ECLKOUT2 low   | 1          | 8               | ns   |

- (1) This cycle-to-cycle jitter specification was measured with CPU/4 or CPU/6 as the source of the EMIF input clock.

Figure 5-10. ECLKOUT2 Timing for EMIFA and EMIFB Modules

## 5.2 ASYNCHRONOUS MEMORY TIMING

### 5.2.1 Timing Requirements for Asynchronous Memory Cycles for EMIFA Module <sup>(1) (2) (3)</sup> (see Figure 5-11 and Figure 5-12)

| NO. | PARAMETER                                                             | -50xEP |     | UNIT |
|-----|-----------------------------------------------------------------------|--------|-----|------|
|     |                                                                       | MIN    | MAX |      |
| 3   | $t_{su}(EDV-AREH)$ Setup time, EDx valid before $\overline{ARE}$ high | 6.5    |     | ns   |
| 4   | $t_h(AREH-EDV)$ Hold time, EDx valid after $\overline{ARE}$ high      | 1      |     | ns   |
| 6   | $t_{su}(ARDY-EKO1H)$ Setup time, ARDY valid before ECLKOUT1 high      | 3      |     | ns   |
| 7   | $t_h(EKO1H-ARDY)$ Hold time, ARDY valid after ECLKOUT1 high           | 1.5    |     | ns   |

- (1) To ensure data setup time, program the strobe width wide enough. ARDY is internally synchronized. The ARDY is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.
- (2) RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.
- (3) These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the asynchronous memory access signals are shown as generic (AOE, ARE, and AWE) instead of AAOE, AARE, and AAW (for EMIFA) and BAOE, BARE, and BAW (for EMIFB)].

| NO. | PARAMETER                                                                              | -50xEP            |     | UNIT |
|-----|----------------------------------------------------------------------------------------|-------------------|-----|------|
|     |                                                                                        | MIN               | MAX |      |
| 1   | $t_{osu}(SELV-AREL)$ Output setup time, select signals valid to $\overline{ARE}$ low   | $RS \times E-1.5$ |     | ns   |
| 2   | $t_{oh}(AREH-SELIV)$ Output hold time, $\overline{ARE}$ high to select signals invalid | $RH \times E-1.9$ |     | ns   |
| 5   | $t_d(EKO1H-AREV)$ Delay time, ECLKOUT1 high to $\overline{ARE}$ valid                  | 1                 | 7   | ns   |
| 8   | $t_{osu}(SELV-AWEL)$ Output setup time, select signals valid to $\overline{AWE}$ low   | $WS \times E-1.7$ |     | ns   |
| 9   | $t_{oh}(AWEH-SELIV)$ Output hold time, $\overline{AWE}$ high to select signals invalid | $WH \times E-1.8$ |     | ns   |
| 10  | $t_d(EKO1H-AWEV)$ Delay time, ECLKOUT1 high to $\overline{AWE}$ valid                  | 1.3               | 7.1 | ns   |

### 5.2.3 Timing Requirements for Asynchronous Memory Cycles for EMIFB Module <sup>(1) (2) (3)</sup> (see Figure 5-11 and Figure 5-12)

| NO. | PARAMETER                                                             | -50xEP |     | UNIT |
|-----|-----------------------------------------------------------------------|--------|-----|------|
|     |                                                                       | MIN    | MAX |      |
| 3   | $t_{su}(EDV-AREH)$ Setup time, EDx valid before $\overline{ARE}$ high | 6.2    |     | ns   |
| 4   | $t_h(AREH-EDV)$ Hold time, EDx valid after $\overline{ARE}$ high      | 1      |     | ns   |

- (1) To ensure data setup time, program the strobe width wide enough. ARDY is internally synchronized. The ARDY is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.
- (2) RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.
- (3) These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the asynchronous memory access signals are shown as generic (AOE, ARE, and AWE) instead of AAOE, AARE, and AAW (for EMIFA) and BAOE, BARE, and BAW (for EMIFB)].

| NO. | PARAMETER                                                        | –50xEP |     | UNIT |
|-----|------------------------------------------------------------------|--------|-----|------|
|     |                                                                  | MIN    | MAX |      |
| 6   | $t_{su(ARDY-EK01H)}$ Setup time, ARDY valid before ECLKOUT1 high | 3      |     | ns   |
| 7   | $t_{h(EK01H-ARDY)}$ Hold time, ARDY valid after ECLKOUT1 high    | 1.7    |     | ns   |

| NO. | PARAMETER                                                                              | –50xEP            |     | UNIT |
|-----|----------------------------------------------------------------------------------------|-------------------|-----|------|
|     |                                                                                        | MIN               | MAX |      |
| 1   | $t_{osu(SELV-ARE)}$ Output setup time, select signals valid to $\overline{ARE}$ low    | $RS \times E-1.6$ |     | ns   |
| 2   | $t_{oh(AREH-SELIV)}$ Output hold time, $\overline{ARE}$ high to select signals invalid | $RH \times E-1.7$ |     | ns   |
| 5   | $t_d(EK01H-AREV)$ Delay time, ECLKOUT1 high to $\overline{ARE}$ valid                  | 0.8               | 6.6 | ns   |
| 8   | $t_{osu(SELV-AWE)}$ Output setup time, select signals valid to $\overline{AWE}$ low    | $WS \times E-1.9$ |     | ns   |
| 9   | $t_{oh(AWEH-SELIV)}$ Output hold time, $\overline{AWE}$ high to select signals invalid | $WH \times E-1.7$ |     | ns   |
| 10  | $t_d(EK01H-AWEV)$ Delay time, ECLKOUT1 high to $\overline{AWE}$ valid                  | 0.9               | 6.7 | ns   |

NOTE: These C64xE devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the asynchronous memory access signals are shown as generic ( $\overline{AOE}$ ,  $\overline{ARE}$ , and  $\overline{AWE}$ ) instead of  $\overline{AAOE}$ ,  $\overline{AARE}$ , and  $\overline{AAWE}$  (for EMIFA) and  $\overline{BAOE}$ ,  $\overline{BARE}$ , and  $\overline{BAWE}$  (for EMIFB)].

- A.  $\overline{AOE}/\overline{SDRAS}/\overline{SOE}$ ,  $\overline{ARE}/\overline{SDCAS}/\overline{SADS}/\overline{SRE}$ , and  $\overline{AWE}/\overline{SDWE}/\overline{SWE}$  operate as  $\overline{AOE}$  (identified under select signals),  $\overline{ARE}$ , and  $\overline{AWE}$ , respectively, during asynchronous memory accesses.

**Figure 5-11. Asynchronous Memory Read Timing for EMIFA and EMIFB (see NOTE NoLabel )**

NOTE: These C64xE devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the asynchronous memory access signals are shown as generic (AOE, ARE, and AWE) instead of AAOE, AARE, and AAW (for EMIFA) and BAOE, BARE, and BAW (for EMIFB)].

- A. AOE/SDRAS/SOE, ARE/SDCAS/SADS/SRE, and AWE/SDWE/SWE operate as AOE (identified under select signals), ARE, and AWE, respectively, during asynchronous memory accesses.

## 5.3 PROGRAMMABLE SYNCHRONOUS INTERFACE TIMING

### 5.3.1 Timing Requirements for Programmable Synchronous Interface Cycles for EMIFA Module <sup>(1)</sup> (see Figure 5-13)

| NO. | PARAMETER                                                          | -50xEP |     | UNIT |
|-----|--------------------------------------------------------------------|--------|-----|------|
|     |                                                                    | MIN    | MAX |      |
| 6   | $t_{su(EDV-EKOH)}$ Setup time, read EDx valid before ECLKOUTx high | 3.1    |     | ns   |
| 7   | $t_{h(EKOH-EDV)}$ Hold time, read EDx valid after ECLKOUTx high    | 1.5    |     | ns   |

- (1) These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the programmable synchronous interface access signals are shown as generic (SADS/SRE, SOE, and SWE) instead of ASADS/ASRE, ASOE, and ASWE (for EMIFA) and BSADS/BSRE, BSOE, and BSWE (for EMIFB)].

| NO. | PARAMETER                                                   | -50xEP |     | UNIT |
|-----|-------------------------------------------------------------|--------|-----|------|
|     |                                                             | MIN    | MAX |      |
| 1   | $t_{d(EKOH-CEV)}$ Delay time, ECLKOUTx high to CEx valid    | 1.3    | 6.4 | ns   |
| 2   | $t_{d(EKOH-BEV)}$ Delay time, ECLKOUTx high to BEx valid    |        | 6.4 | ns   |
| 3   | $t_{d(EKOH-BEIV)}$ Delay time, ECLKOUTx high to BEx invalid | 1.3    |     | ns   |
| 4   | $t_{d(EKOH-EAV)}$ Delay time, ECLKOUTx high to EAx valid    |        | 6.4 | ns   |
| 5   | $t_{d(EKOH-EAIV)}$ Delay time, ECLKOUTx high to EAx invalid | 1.3    |     | ns   |

| NO. | PARAMETER                                                                               | –50xEP |     | UNIT |
|-----|-----------------------------------------------------------------------------------------|--------|-----|------|
|     |                                                                                         | MIN    | MAX |      |
| 8   | $t_{d(EK0xH-ADSV)}$ Delay time, ECLKOUTx high to $\overline{SADS}/\overline{SRE}$ valid | 1.3    | 6.4 | ns   |
| 9   | $t_{d(EK0xH-OEV)}$ Delay time, ECLKOUTx high to, $\overline{SOE}$ validE                | 1.3    | 6.4 | ns   |
| 10  | $t_{d(EK0xH-EDV)}$ Delay time, ECLKOUTx high to $\overline{EDx}$ valid                  |        | 6.4 | ns   |
| 11  | $t_{d(EK0xH-EDIV)}$ Delay time, ECLKOUTx high to $\overline{EDx}$ invalidE              | 1.3    |     | ns   |
| 12  | $t_{d(EK0xH-WEV)}$ Delay time, ECLKOUTx high to $\overline{SWE}$ valid                  | 1.3    | 6.4 | ns   |

### 5.3.3 Timing Requirements for Programmable Synchronous Interface Cycles for EMIFB Module <sup>(1)</sup> (see [Figure 5-13](#))

| NO. | PARAMETER                                                           | –50xEP |     | UNIT |
|-----|---------------------------------------------------------------------|--------|-----|------|
|     |                                                                     | MIN    | MAX |      |
| 6   | $t_{su(EDV-EK0xH)}$ Setup time, read EDx valid before ECLKOUTx high | 3.1    |     | ns   |
| 7   | $t_h(EK0xH-EDV)$ Hold time, read EDx valid after ECLKOUTx high      | 1.5    |     | ns   |

- (1) These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the programmable synchronous interface access signals are shown as generic ( $\overline{SADS}/\overline{SRE}$ ,  $\overline{SOE}$ , and  $\overline{SWE}$ ) instead of  $\overline{ASADS}/\overline{ASRE}$ ,  $\overline{ASOE}$ , and  $\overline{ASWE}$  (for EMIFA) and  $\overline{BSADS}/\overline{BSRE}$ ,  $\overline{BSOE}$ , and  $\overline{BSWE}$  (for EMIFB)].

| NO. | PARAMETER                                                                               | –50xEP |     | UNIT |
|-----|-----------------------------------------------------------------------------------------|--------|-----|------|
|     |                                                                                         | MIN    | MAX |      |
| 1   | $t_{d(EK0xH-CEV)}$ Delay time, ECLKOUTx high to $\overline{CEx}$ valid                  | 1.3    | 6.4 | ns   |
| 2   | $t_{d(EK0xH-BEV)}$ Delay time, ECLKOUTx high to $\overline{BEx}$ valid                  |        | 6.4 | ns   |
| 3   | $t_{d(EK0xH-BEIV)}$ Delay time, ECLKOUTx high to $\overline{BEx}$ invalidE              | 1.3    |     | ns   |
| 4   | $t_{d(EK0xH-EAV)}$ Delay time, ECLKOUTx high to EAx valid                               |        | 6.4 | ns   |
| 5   | $t_{d(EK0xH-EAIV)}$ Delay time, ECLKOUTx high to EAx invalid                            | 1.3    |     | ns   |
| 8   | $t_{d(EK0xH-ADSV)}$ Delay time, ECLKOUTx high to $\overline{SADS}/\overline{SRE}$ valid | 1.3    | 6.4 | ns   |
| 9   | $t_{d(EK0xH-OEV)}$ Delay time, ECLKOUTx high to, $\overline{SOE}$ validE                | 1.3    | 6.4 | ns   |
| 10  | $t_{d(EK0xH-EDV)}$ Delay time, ECLKOUTx high to $\overline{EDx}$ valid                  |        | 6.4 | ns   |
| 11  | $t_{d(EK0xH-EDIV)}$ Delay time, ECLKOUTx high to $\overline{EDx}$ invalidE              | 1.3    |     | ns   |
| 12  | $t_{d(EK0xH-WEV)}$ Delay time, ECLKOUTx high to $\overline{SWE}$ valid                  | 1.3    | 6.4 | ns   |

- A. These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the programmable synchronous interface access signals are shown as generic ( $\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{SOE}}$ , and  $\overline{\text{SWE}}$ ) instead of  $\overline{\text{ASADS}}/\overline{\text{ASRE}}$ ,  $\overline{\text{ASOE}}$ , and  $\overline{\text{ASWE}}$  (for EMIFA) and  $\overline{\text{BSADS}}/\overline{\text{BSRE}}$ ,  $\overline{\text{BSOE}}$ , and  $\overline{\text{BSWE}}$  (for EMIFB)].
- B. The read latency and the length of  $\overline{\text{CEX}}$  assertion are programmable via the SYNCRL and CEEXT fields, respectively, in the EMIFx CE Space Secondary Control register (CExSEC). In this figure, SYNCRL = 2 and CEEXT = 0.
- C. The following parameters are programmable via the EMIF CE Space Secondary Control register (CExSEC):
  - a. Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency.
  - b. Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
  - c.  $\overline{\text{CEX}}$  assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface,  $\overline{\text{CEX}}$  goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue,  $\overline{\text{CEX}}$  is active when  $\overline{\text{SOE}}$  is active (CEEXT = 1).
  - d. Function of  $\overline{\text{SADS}}/\overline{\text{SRE}}$  (RENEN): For standard SBSRAM or ZBT SRAM interface,  $\overline{\text{SADS}}/\overline{\text{SRE}}$  acts as  $\overline{\text{SADS}}$  with deselection cycles (RENEN = 0). For FIFO interface,  $\overline{\text{SADS}}/\overline{\text{SRE}}$  acts as  $\overline{\text{SRE}}$  with NO deselection cycles (RENEN = 1).
  - e. Synchronization clock (SNCLK): Synchronized to ECLKOUT1 or ECLKOUT2
- D.  $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SOE}}$  and  $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SWE}}$  operate as  $\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{SOE}}$ , and  $\overline{\text{SWE}}$ , respectively, during programmable synchronous interface accesses.

**Figure 5-13. Programmable Synchronous Interface Read Timing for EMIFA and EMIFB (With Read Latency = 2) (See Notes A, B, C)**

- A. These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the programmable synchronous interface access signals are shown as generic ( $\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{SOE}}$ , and  $\overline{\text{SWE}}$ ) instead of  $\overline{\text{ASADS}}/\overline{\text{ASRE}}$ ,  $\overline{\text{ASOE}}$ , and  $\overline{\text{ASWE}}$  (for EMIFA) and  $\overline{\text{BSADS}}/\overline{\text{BSRE}}$ ,  $\overline{\text{BSOE}}$ , and  $\overline{\text{BSWE}}$  (for EMIFB)].
- B. The write latency and the length of  $\overline{\text{CEX}}$  assertion are programmable via the SYNCWL and CEEXT fields, respectively, in the EMIFx CE Space Secondary Control register (CEXSEC). In this figure, SYNCWL = 0 and CEEXT = 0.
- C. The following parameters are programmable via the EMIF CE Space Secondary Control register (CEXSEC):
  - a. Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency.
  - b. Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
  - c.  $\overline{\text{CEX}}$  assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface,  $\overline{\text{CEX}}$  goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue,  $\overline{\text{CEX}}$  is active when  $\overline{\text{SOE}}$  is active (CEEXT = 1).
  - d. Function of  $\overline{\text{SADS}}/\overline{\text{SRE}}$  (RENEN): For standard SBSRAM or ZBT SRAM interface,  $\overline{\text{SADS}}/\overline{\text{SRE}}$  acts as  $\overline{\text{SADS}}$  with deselect cycles (RENEN = 0). For FIFO interface,  $\overline{\text{SADS}}/\overline{\text{SRE}}$  acts as  $\overline{\text{SRE}}$  with NO deselect cycles (RENEN = 1).
  - e. Synchronization clock (SNCLK): Synchronized to ECLKOUT1 or ECLKOUT2
- D.  $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SOE}}$  and  $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SWE}}$  operate as  $\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{SOE}}$ , and  $\overline{\text{SWE}}$ , respectively, during programmable synchronous interface accesses.

**Figure 5-14. Programmable Synchronous Interface Write Timing for EMIFA and EMIFB (With Write Latency = 0) (See Notes A, B, C)**

- A. These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the programmable synchronous interface access signals are shown as generic ( $\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{SOE}}$ , and  $\overline{\text{SWE}}$ ) instead of  $\overline{\text{ASADS}}/\overline{\text{ASRE}}$ ,  $\overline{\text{ASOE}}$ , and  $\overline{\text{ASWE}}$  (for EMIFA) and  $\overline{\text{BSADS}}/\overline{\text{BSRE}}$ ,  $\overline{\text{BSOE}}$ , and  $\overline{\text{BSWE}}$  (for EMIFB)].
- B. The write latency and the length of  $\overline{\text{CEx}}$  assertion are programmable via the SYNCWL and CEEXT fields, respectively, in the EMIFx CE Space Secondary Control register (CEXSEC). In this figure, SYNCWL = 1 and CEEXT = 0.
- C. The following parameters are programmable via the EMIF CE Space Secondary Control register (CEXSEC):
  - a. Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency.
  - b. Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
  - c.  $\overline{\text{CEx}}$  assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface,  $\overline{\text{CEx}}$  goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue,  $\overline{\text{CEx}}$  is active when  $\overline{\text{SOE}}$  is active (CEEXT = 1).
  - d. Function of  $\overline{\text{SADS}}/\overline{\text{SRE}}$  (RENEN): For standard SBSRAM or ZBT SRAM interface,  $\overline{\text{SADS}}/\overline{\text{SRE}}$  acts as  $\overline{\text{SADS}}$  with deselection cycles (RENEN = 0). For FIFO interface,  $\overline{\text{SADS}}/\overline{\text{SRE}}$  acts as  $\overline{\text{SRE}}$  with NO deselection cycles (RENEN = 1).
  - e. Synchronization clock (SNCLK): Synchronized to ECLKOUT1 or ECLKOUT2
- D.  $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SOE}}$ , and  $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SWE}}$  operate as  $\overline{\text{SADS}}/\overline{\text{SRE}}$ ,  $\overline{\text{SOE}}$ , and  $\overline{\text{SWE}}$ , respectively, during programmable synchronous interface accesses.

**Figure 5-15. Programmable Synchronous Interface Write Timing for EMIFA and EMIFB (With Write Latency = 1) See Notes A, B, C)**

## 5.4 SYNCHRONOUS DRAM TIMING

### 5.4.1 Timing Requirements for Synchronous DRAM Cycles for EMIFA Module (see Figure 5-16)

| NO. | PARAMETER                                                                         | -50xEP |     | UNIT |
|-----|-----------------------------------------------------------------------------------|--------|-----|------|
|     |                                                                                   | MIN    | MAX |      |
| 6   | $t_{\text{su}}(\text{EDV-EK01H})$ Setup time, read EDx valid before ECLKOUT1 high | 2.1    |     | ns   |
| 7   | $t_{\text{h}}(\text{EK01H-EDV})$ Hold time, read EDx valid after ECLKOUT1 high    | 2.5    |     | ns   |

| NO. | PARAMETER            |                                                        | –50xEP |     | UNIT |
|-----|----------------------|--------------------------------------------------------|--------|-----|------|
|     |                      |                                                        | MIN    | MAX |      |
| 1   | $t_{d(EKO1H-CEV)}$   | Delay time, ECLKOUT1 high to $\overline{CEx}$ valid    | 1.3    | 6.4 | ns   |
| 2   | $t_{d(EKO1H-BEV)}$   | Delay time, ECLKOUT1 high to $\overline{BEx}$ valid    |        | 6.4 | ns   |
| 3   | $t_{d(EKO1H-BEIV)}$  | Delay time, ECLKOUT1 high to $\overline{BEx}$ invalid  | 1.3    |     | ns   |
| 4   | $t_{d(EKO1H-EAV)}$   | Delay time, ECLKOUT1 high to EAx valid                 |        | 6.4 | ns   |
| 5   | $t_{d(EKO1H-EAIV)}$  | Delay time, ECLKOUT1 high to EAx invalid               | 1.3    |     | ns   |
| 8   | $t_{d(EKO1H-CASV)}$  | Delay time, ECLKOUT1 high to $\overline{SDCAS}$ valid  | 1.3    | 6.4 | ns   |
| 9   | $t_{d(EKO1H-EDV)}$   | Delay time, ECLKOUT1 high to $\overline{EDx}$ valid    |        | 6.4 | ns   |
| 10  | $t_{d(EKO1H-EDIV)}$  | Delay time, ECLKOUT1 high to $\overline{EDx}$ invalid  | 1.3    |     | ns   |
| 11  | $t_{d(EKO1H-WEV)}$   | Delay time, ECLKOUT1 high to $\overline{SDWE}$ valid   | 1.3    | 6.4 | ns   |
| 12  | $t_{d(EKO1H-RAS)}$   | Delay time, ECLKOUT1 high to $\overline{SDRAS}$ valid  | 1.3    | 6.4 | ns   |
| 13  | $t_{d(EKO1H-ACKEV)}$ | Delay time, ECLKOUT1 high to ASDCKE valid (EMIFA only) | 1.3    | 6.4 | ns   |
| 14  | $t_{d(EKO1H-PDTV)}$  | Delay time, ECLKOUT1 high to $\overline{PDT}$ valid    | 1.3    | 6.4 | ns   |

### 5.4.3 Timing Requirements for Synchronous DRAM Cycles for EMIFB Module<sup>(1)</sup>(see Figure 5-16)

| NO. | PARAMETER           |                                                 | –50xEP |     | UNIT |
|-----|---------------------|-------------------------------------------------|--------|-----|------|
|     |                     |                                                 | MIN    | MAX |      |
| 6   | $t_{su(EDV-EKO1H)}$ | Setup time, read EDx valid before ECLKOUT1 high | 2.1    |     | ns   |
| 7   | $t_h(EKO1H-EDV)$    | Hold time, read EDx valid after ECLKOUT1 high   | 2.5    |     | ns   |

- (1) These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic (  $\overline{SDCAS}$ ,  $\overline{SDWE}$ , and  $\overline{SDRAS}$  ) instead of  $\overline{ASDCAS}$ ,  $\overline{ASDWE}$ , and  $\overline{ASDRAS}$  (for EMIFA) and  $\overline{BSDCAS}$ ,  $\overline{BSDWE}$ , and  $\overline{BSDRAS}$  (for EMIFB)].

| NO. | PARAMETER            |                                                        | –50xEP |     | UNIT |
|-----|----------------------|--------------------------------------------------------|--------|-----|------|
|     |                      |                                                        | MIN    | MAX |      |
| 1   | $t_{d(EKO1H-CEV)}$   | Delay time, ECLKOUT1 high to $\overline{CEx}$ valid    | 1.3    | 6.4 | ns   |
| 2   | $t_{d(EKO1H-BEV)}$   | Delay time, ECLKOUT1 high to $\overline{BEx}$ valid    |        | 6.4 | ns   |
| 3   | $t_{d(EKO1H-BEIV)}$  | Delay time, ECLKOUT1 high to $\overline{BEx}$ invalid  | 1.3    |     | ns   |
| 4   | $t_{d(EKO1H-EAV)}$   | Delay time, ECLKOUT1 high to EAx valid                 |        | 6.4 | ns   |
| 5   | $t_{d(EKO1H-EAIV)}$  | Delay time, ECLKOUT1 high to EAx invalid               | 1.3    |     | ns   |
| 8   | $t_{d(EKO1H-CASV)}$  | Delay time, ECLKOUT1 high to $\overline{SDCAS}$ valid  | 1.3    | 6.4 | ns   |
| 9   | $t_{d(EKO1H-EDV)}$   | Delay time, ECLKOUT1 high to $\overline{EDx}$ valid    |        | 6.4 | ns   |
| 10  | $t_{d(EKO1H-EDIV)}$  | Delay time, ECLKOUT1 high to $\overline{EDx}$ invalidE | 1.3    |     | ns   |
| 11  | $t_{d(EKO1H-WEV)}$   | Delay time, ECLKOUT1 high to $\overline{SDWE}$ valid   | 1.3    | 6.4 | ns   |
| 12  | $t_{d(EKO1H-RAS)}$   | Delay time, ECLKOUT1 high to $\overline{SDRAS}$ valid  | 1.3    | 6.4 | ns   |
| 13  | $t_{d(EKO1H-ACKEV)}$ | Delay time, ECLKOUT1 high to ASDCKE valid (EMIFA only) | 1.3    | 6.4 | ns   |
| 14  | $t_{d(EKO1H-PDTV)}$  | Delay time, ECLKOUT1 high to $\overline{PDT}$ valid    | 1.3    | 6.4 | ns   |

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ( $\overline{SDCAS}$ ,  $\overline{SDWE}$ , and  $\overline{SDRAS}$ ) instead of  $\overline{ASDCAS}$ ,  $\overline{ASDWE}$ , and  $\overline{ASDRAS}$  (for EMIFA) and  $\overline{BSDCAS}$ ,  $\overline{BSDWE}$ , and  $\overline{BSDRAS}$  (for EMIFB)].

- A.  $\overline{ARE/SDCAS/SADS/SRE}$ ,  $\overline{AWE/SDWE/SWE}$  and  $\overline{AOE/SDRAS/SOE}$  operate as  $\overline{SDCAS}$ ,  $\overline{SDWE}$ ,  $\overline{SOE}$ , and  $\overline{SDRAS}$ , respectively, during SDRAM accesses.
- B.  $\overline{PDT}$  signal is only asserted when the EDMA is in PDT mode (set the PDTS bit to 1 in the EDMA options parameter RAM). For  $\overline{PDT}$  read, data is not latched into EMIF. The PDTRAL field in the PDT control register (PDTCTL) configures the latency of the  $\overline{PDT}$  signal with respect to the data phase of read transaction. The latency of the  $\overline{PDT}$  signal for a read can be programmed to 0, 1, 2, or 3 by setting PDTRL to 00, 01, 10, or 11, respectively. PDTRL equals 00 (zero latency) in Figure 22.

**Figure 5-16. SDRAM Read Command (CAS Latency 3) for EMIFA and EMIFB (see Note)**

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ( $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ ) instead of  $\overline{\text{ASDCAS}}$ ,  $\overline{\text{ASDWE}}$ , and  $\overline{\text{ASDRAS}}$  (for EMIFA) and  $\overline{\text{BSDCAS}}$ ,  $\overline{\text{BSDWE}}$ , and  $\overline{\text{BSDRAS}}$  (for EMIFB)].

- $\overline{\text{ARE/SDCAS/SADS/SRE}}$ ,  $\overline{\text{AWE/SDWE/SWE}}$  and  $\overline{\text{AOE/SDRAS/SOE}}$  operate as  $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ , respectively, during SDRAM accesses.
- $\overline{\text{PDT}}$  signal is only asserted when the EDMA is in PDT mode (set the PDTD bit to 1 in the EDMA options parameter RAM). For  $\overline{\text{PDT}}$  write, data is not driven (in High-Z). The PDTWL field in the PDT control register (PDTCTL) configures the latency of the  $\overline{\text{PDT}}$  signal with respect to the data phase of write transaction. The latency of the  $\overline{\text{PDT}}$  signal for a write can be programmed to 0, 1, 2, or 3 by setting PDTWL to 00, 01, 10, or 11, respectively. PDTWL equals 00 (zero latency) in Figure 23.

**Figure 5-17. SDRAM Write Command for EMIFA and EMIFB (see Note)**

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ( $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ ) instead of  $\overline{\text{ASDCAS}}$ ,  $\overline{\text{ASDWE}}$ , and  $\overline{\text{ASDRAS}}$  (for EMIFA) and  $\overline{\text{BSDCAS}}$ ,  $\overline{\text{BSDWE}}$ , and  $\overline{\text{BSDRAS}}$  (for EMIFB)].

- A.  $\overline{\text{ARE/SDCAS/SADS/SRE}}$ ,  $\overline{\text{AWE/SDWE/SWE}}$  and  $\overline{\text{AOE/SDRAS/SOE}}$  operate as  $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ , respectively, during SDRAM accesses.

**Figure 5-18. SDRAM ACTV Command for EMIFA and EMFB (see Note)**

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ( $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ ) instead of  $\overline{\text{ASDCAS}}$ ,  $\overline{\text{ASDWE}}$ , and  $\overline{\text{ASDRAS}}$  (for EMIFA) and  $\overline{\text{BSDCAS}}$ ,  $\overline{\text{BSDWE}}$ , and  $\overline{\text{BSDRAS}}$  (for EMIFB)].

- A.  $\overline{\text{ARE/SDCAS/SADS/SRE}}$ ,  $\overline{\text{AWE/SDWE/SWE}}$  and  $\overline{\text{AOE/SDRAS/SOE}}$  operate as  $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ , respectively, during SDRAM accesses.

**Figure 5-19. SDRAM DCAB Command for EMIFA and EMIFB (see Note)**

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ( $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ ) instead of  $\overline{\text{ASDCAS}}$ ,  $\overline{\text{ASDWE}}$ , and  $\overline{\text{ASDRAS}}$  (for EMIFA) and  $\overline{\text{BSDCAS}}$ ,  $\overline{\text{BSDWE}}$ , and  $\overline{\text{BSDRAS}}$  (for EMIFB)].

- A.  $\overline{\text{ARE/SDCAS/SADS/SRE}}$ ,  $\overline{\text{AWE/SDWE/SWE}}$  and  $\overline{\text{AOE/SDRAS/SOE}}$  operate as  $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ , respectively, during SDRAM accesses.

**Figure 5-20. SDRAM DEAC Command for EMIFA and EMIFB (see Note)**

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic (SDCAS, SDWE, and SDRAS) instead of ASDCAS, ASDWE, and ASDRAS (for EMIFA) and BSDCAS, BSDWE, and BSDRAS (for EMIFB)].

- A. ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE and AOE/SDRAS/SOE operate as SDCAS, SDWE, and SDRAS, respectively, during SDRAM accesses.

**Figure 5-21. SDRAM REFR Command for EMIFA and EMIFB (see Note)**

NOTE: These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic (SDCAS, SDWE, and SDRAS) instead of ASDCAS, ASDWE, and ASDRAS (for EMIFA) and BSDCAS, BSDWE, and BSDRAS (for EMIFB)].

- A. ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE and AOE/SDRAS/SOE operate as SDCAS, SDWE, and SDRAS, respectively, during SDRAM accesses.

**Figure 5-22. SDRAM MRS Command for EMIFA and EMIFB (see Note)**

- A. These C64x devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ( $\overline{\text{SDCAS}}$ ,  $\overline{\text{SDWE}}$ , and  $\overline{\text{SDRAS}}$ ) instead of  $\overline{\text{ASDCAS}}$ ,  $\overline{\text{ASDWE}}$ , and  $\overline{\text{ASDRAS}}$  (for EMIFA) and  $\overline{\text{BSDCAS}}$ ,  $\overline{\text{BSDWE}}$ , and  $\overline{\text{BSDRAS}}$  (for EMIFB)].
- B.  $\overline{\text{AARE/ASDCAS/ASADS/ASRE}}$ ,  $\overline{\text{AAWE/ASDWE/ASWE}}$ , and  $\overline{\text{AAOE/ASDRAS/ASOE}}$  operate as  $\overline{\text{ASDCAS}}$ ,  $\overline{\text{ASDWE}}$ , and  $\overline{\text{ASDRAS}}$ , respectively, during SDRAM accesses.

Figure 5-23. SDRAM Self-Refresh Timing for EMIFA Only

## 5.5 HOLD/HOLDA TIMING

### 5.5.1 Timing Requirements for the $\overline{\text{HOLD/HOLDA}}$ cycles for EMIFA and EMIFB Modules<sup>(1)</sup>(see Figure 5-24)

| NO. | PARAMETER                                                                                                                   | –50xEP |     | UNIT |
|-----|-----------------------------------------------------------------------------------------------------------------------------|--------|-----|------|
|     |                                                                                                                             | MIN    | MAX |      |
| 3   | $t_{\text{oh}}(\overline{\text{HOLDAL-HOLDL}})$ Hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low | E      |     | ns   |

(1) E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

## 5.6 Switching Characteristics Over Recommended Operating Conditions for the HOLD/HOLDA Cycles for EMIFA and EMIFB Modules <sup>(1)</sup> <sup>(2)</sup> <sup>(3)</sup> (see Figure 5-24)

| NO. | PARAMETER                                                                          | –50xEP |                    | UNIT |
|-----|------------------------------------------------------------------------------------|--------|--------------------|------|
|     |                                                                                    | MIN    | MAX                |      |
| 1   | $t_{d(HOLDL-EMHZ)}$ Delay time, $\overline{HOLD}$ low to EMIF Bus high impedance   | 2E     | See <sup>(4)</sup> | ns   |
| 2   | $t_{d(EMHZ-HOLDAL)}$ Delay time, EMIF Bus high impedance to $\overline{HOLDA}$ low | 0      | 2E                 | ns   |
| 4   | $t_{d(HOLDH-EMLZ)}$ Delay time, $\overline{HOLD}$ high to EMIF Bus low impedance   | 2E     | 7E                 | ns   |
| 5   | $t_{d(EMLZ-HOLDAH)}$ Delay time, EMIF Bus low impedance to $\overline{HOLDA}$ high | 0      | 2E                 | ns   |
| 6   | $t_{d(HOLDL-EKOHZ)}$ Delay time, $\overline{HOLD}$ low to ECLKOUTx high impedance  | 2E     | See <sup>(4)</sup> | ns   |
| 7   | $t_{d(HOLDH-EKOLZ)}$ Delay time, $\overline{HOLD}$ high to ECLKOUTx low impedance  | 2E     | 7E                 | ns   |

- (1) E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB
- (2) For EMIFA, EMIF Bus consists of: ACE[3:0], ABE[7:0], AED[63:0], AEA[22:3], AARE/ASDCAS/ASADS/ASRE, AAOE/ASDRAS/ASOE, and AAW/ASDWE/ASWE, ASDCKE, ASOE3, and APDT.  
For EMIFB, EMIF Bus consists of: BCE[3:0], BBE[1:0], BED[15:0], BEA[20:1], BARE/BSDCAS/BSADS/BSRE, BAOE/BSDRAS/BSOE, and BAW/BSDWE/BSWE, BSOE3, and BPDT.
- (3) The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during  $\overline{HOLDA}$ . If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 5-24.
- (4) All pending EMIF transactions are allowed to complete before  $\overline{HOLDA}$  is asserted. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

- A. For EMIFA, EMIF Bus consists of : ACE[3:0], ABE[7:0], AED[63:0], AEA[22:3], AARE/ASDCAS/ASADS/ASRE, AAOE/ASDRAS/ASOE, and AAW/ASDWE/ASWE, ASDCKE, ASOE3, and APDT.  
For EMIFB, EMIF Bus consists of: BCE[3:0], BBE[1:0], BED[15:0], BEA[20:1], BARE/BSDCAS/BSADS/BSRE, BAOE/BSDRAS/BSOE, and BAW/BSDWE/BSWE, BSOE3, and BPDT.

**Figure 5-24.  $\overline{HOLD}/\overline{HOLDA}$  Timing for EMIFA and EMIFB**

## 5.7 BUSREQ TIMING

| NO. | PARAMETER                                                           | –50xEP |     | UNIT |
|-----|---------------------------------------------------------------------|--------|-----|------|
|     |                                                                     | MIN    | MAX |      |
| 1   | $t_{d(AEKO1H-ABUSRV)}$ Delay time, AECLKOUT1 high to ABUSREQ validA | 0.6    | 7.1 | ns   |
| 2   | $t_{d(BEKO1H-BBUSRV)}$ Delay time, BECLKOUT1 high to BBUSREQ validB | 0.5    | 6.9 | ns   |

Figure 5-25. BUSREQ Timing for EMIFA and EMIFB

## 5.8 RESET TIMING

### 5.8.1 Timing Requirements for Reset<sup>(1)</sup> (see Figure 5-26 )

| NO. | PARAMETER                                                                                              |                                     | -50xEP |     | UNIT    |
|-----|--------------------------------------------------------------------------------------------------------|-------------------------------------|--------|-----|---------|
|     |                                                                                                        |                                     | MIN    | MAX |         |
| 1   | $t_{w(RST)}$ Width of the $\overline{RESET}$ pulse                                                     | PLL stable <sup>(2)</sup>           | 10P    |     | ns      |
|     |                                                                                                        | PLL needs to sync up <sup>(3)</sup> | 250    |     | $\mu$ s |
| 16  | $t_{su(boot)}$ Setup time, boot configuration bits valid before $\overline{RESET}$ high <sup>(4)</sup> |                                     | 4P     |     | ns      |
| 17  | $t_{h(boot)}$ Hold time, boot configuration bits valid after $\overline{RESET}$ high <sup>(4)</sup>    |                                     | 4P     |     | ns      |

(1)  $P = 1/\text{CPU clock frequency}$  in ns. For example, when running parts at 500 MHz, use  $P = 2$  ns.

(2) This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x6, x12 when CLKIN and PLL are stable.

(3) This parameter applies to CLKMODE x6, x12 only (it does not apply to CLKMODE x1). The  $\overline{RESET}$  signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to  $250 = s$  to stabilize following device power up or after PLL configuration has been changed. During that time,  $\overline{RESET}$  must be asserted to ensure proper device operation. See the clock PLL section for PLL lock times.

(4) EMIFB address pins BEA[20:13, 11, 7] are the boot-configuration pins during device reset.

| NO. | PARAMETER             |                                                                       | -50xEP |            | UNIT |
|-----|-----------------------|-----------------------------------------------------------------------|--------|------------|------|
|     |                       |                                                                       | MIN    | MAX        |      |
| 2   | $t_{d(RSTL-ECKI)}$    | Delay time, $\overline{RESET}$ low to ECLKIN synchronized internally  | 2E     | $3P + 20E$ | ns   |
| 3   | $t_{d(RSTH-ECKI)}$    | Delay time, $\overline{RESET}$ high to ECLKIN synchronized internally | 2E     | $8P + 20E$ | ns   |

| 16  | $t_{d(PCLK-RSTH)}$    | Delay time, PCLK active to $\overline{RESET}$ high <sup>(3)</sup>     | 32N    |            | ns   |

- A. These C64x. devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an A and all EMIFB signals are prefixed by a B. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix A or B may be omitted [e.g., ECLKIN, ECLKOUT1, and ECLKOUT2].
- B. The following groups consist of:
  - a. **EMIF Z group consists of:** AEA[22:3], BEA[20:1], AED[63:0], BED[15:0], CE[3:0], ABE[7:0], BBE[1:0], ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE, and AOE/SDRAS/SOE, SOE3, ASDCKE, and PDT.
  - b. **EMIF high group consists of:** AHOLDA and BHOLDA (when the corresponding HOLD input is high)
  - c. **EMIF low group consists of:** ABUSREQ and BBUSREQ; AHOLD $\bar{A}$  and BHOLD $\bar{A}$  (when the corresponding HOLD input is low)
  - d. **Low group consists of:** XSP\_CS, CLKX2/XSP\_CLK, and DX2/XSP\_DO; all of which apply only when PCI EEPROM (BEA13) is enabled (with PCI\_EN = 1 and MCBSP2\_EN = 0). Otherwise, the CLKX2/XSP\_CLK and DX2/XSP\_DO pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.
  - e. **Z group consists of :** HD[310]/AD[31:0], CLKX0, CLKX1/URADDR4, CLKX2/XSP\_CLK, FSX0, FSX1/UXADDR3, FSX2, DX0, DX1/UXADDR4, DX2/XSP\_DO, CLKR0, CLKR1/URADDR2, CLKR2, FSR0, FSR1/UXADDR2, FSR2, TOUT0, TOUT1, TOUT2, GP[8:0], GP10/PCBE3, HRW/PCBE2, HDS2/PCBE1, PCBE0, GP13/PINTA, GP11/PREQ, HDS1/PSERR, HCS/PPERR, HCNTL1/PDEVSEL, HAS/PPAR, HCNTL0/PSTOP, HHWIL/PTRDY (16-bit HPI mode only), HRDY/PIRDY, HINT/PFRAME, UXDATA[7:0], UXSOC, UXCLAV, and URCLAV.
- C. If BEA[20:13, 11, 7] and HD5/AD5 pins are actively driven, care must be taken to ensure no timing contention between parameters 6, 7, 14, 15, 16, and 17.
- D. Boot and Device Configurations Inputs (during reset) include: EMIFB address pins BEA[20:13, 11, 7] and HD5/AD5. The CI\_EN pin must be driven valid at all times and the user must not switch values throughout device operation. The MCBSP2\_EN pin must be driven valid at all times and the user can switch values throughout device operation.

**Figure 5-26. Reset Timing<sup>(A)</sup>**

## 5.9 EXTERNAL INTERRUPT TIMING

### 5.9.1 Timing Requirements for External Interrupts<sup>(1)</sup> (see Figure 5-27)

| NO. | PARAMETER       |                                           | –50xEP |     | UNIT |
|-----|-----------------|-------------------------------------------|--------|-----|------|
|     |                 |                                           | MIN    | MAX |      |
| 1   | $t_{w(LLOW)}$   | Width of the NMI interrupt pulse low      | 4P     |     | ns   |
|     |                 | Width of the EXT_INT interrupt pulse low  | 8P     |     | ns   |
| 2   | $t_{w(HHIGH)H}$ | Width of the NMI interrupt pulse high     | 4P     |     | ns   |
|     |                 | Width of the EXT_INT interrupt pulse high | 8P     |     | ns   |

(1) P = 1/CPU clock frequency in ns. For example, when running parts at 500 MHz, use P = 2 ns.

Figure 5-27. External/NMI Interrupt Timing

## 5.10 HOST-PORT INTERFACE (HPI)

### 5.10.1 Timing Requirements for Host-Port Interface Cycles<sup>(1)</sup> <sup>(2)</sup> (see Figure 5-28 through Figure 5-35)

| NO. | PARAMETER            |                                                                                                                                                                                                            | –50xEP            |     | UNIT |
|-----|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-----|------|
|     |                      |                                                                                                                                                                                                            | MIN               | MAX |      |
| 1   | $t_{su(SELV-HSTBL)}$ | Setup time, select signals <sup>(3)</sup> valid before $\overline{HSTROBE}$ low                                                                                                                            | 5                 |     | ns   |
| 2   | $t_h(HSTBL-SELV)$    | Hold time, select signals <sup>(3)</sup> valid after $\overline{HSTROBE}$ low                                                                                                                              | 2.4               |     | ns   |
| 3   | $t_w(HSTBL)$         | Pulse duration, $\overline{HSTROBE}$ low                                                                                                                                                                   | 4P <sup>(4)</sup> |     | ns   |
| 4   | $t_w(HSTBH)$         | Pulse duration, $\overline{HSTROBE}$ high between consecutive accesses                                                                                                                                     | 4P                |     | ns   |
| 10  | $t_{su(SELV-HASL)}$  | Setup time, select signals <sup>(3)</sup> valid before $\overline{HAS}$ low                                                                                                                                | 5                 |     | ns   |
| 11  | $t_h(HASL-SELV)$     | Hold time, select signals <sup>(3)</sup> valid after $\overline{HAS}$ low                                                                                                                                  | 2                 |     | ns   |
| 12  | $t_{su(HDV-HSTBH)}$  | Setup time, host data valid before $\overline{HSTROBE}$ high                                                                                                                                               | 5                 |     | ns   |
| 13  | $t_h(HSTBH-HDV)$     | Hold time, host data valid after $\overline{HSTROBE}$ high                                                                                                                                                 | 2.8               |     | ns   |
| 14  | $t_h(HRDYL-HSTBL)$   | Hold time, $\overline{HSTROBE}$ low after $\overline{HRDY}$ low. $\overline{HSTROBE}$ should not be inactivated until $\overline{HRDY}$ is active (low); otherwise, HPI writes will not complete properly. | 2                 |     | ns   |
| 18  | $t_{su(HASL-HSTBL)}$ | Setup time, $\overline{HAS}$ low before $\overline{HSTROBE}$ low                                                                                                                                           | 2                 |     | ns   |
| 19  | $t_h(HSTBL-HASL)$    | Hold time, $\overline{HAS}$ low after $\overline{HSTROBE}$ low                                                                                                                                             | 2.1               |     | ns   |

(1)  $\overline{HSTROBE}$  refers to the following logical operation on  $\overline{HCS}$ ,  $\overline{HDS1}$ , and  $\overline{HDS2}$ :  $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$ .

(2) P = 1/CPU clock frequency in ns. For example, when running parts at 500 MHz, use P = 2 ns.

(3) Select signals include:  $\overline{HCNTL}[1:0]$  and  $\overline{HR/W}$ . For HPI16 mode only, select signals also include  $\overline{HHWIL}$ .

(4) Select the parameter value of 4P or 12.5 ns, whichever is greater.

| NO. | PARAMETER           |                                                                               | –50xEP |        | UNIT |
|-----|---------------------|-------------------------------------------------------------------------------|--------|--------|------|
|     |                     |                                                                               | MIN    | MAX    |      |
| 6   | $t_d(HSTBL-HRDYH)$  | Delay time, $\overline{HSTROBE}$ low to $\overline{HRDY}$ high <sup>(1)</sup> | 1.3    | 4P + 9 | ns   |
| 7   | $t_d(HSTBL-HDLZ)$   | Delay time, $\overline{HSTROBE}$ low to HD low impedance for an HPI read      | 2      |        | ns   |
| 8   | $t_d(HDV-HRDYL)$    | Delay time, HD valid to $\overline{HRDY}$ low                                 | –3     |        | ns   |
| 9   | $t_{oh}(HSTBH-HDV)$ | Output hold time, HD valid after $\overline{HSTROBE}$ high                    | 1.5    |        | ns   |

(1) This parameter is used during HPID reads and writes. For reads, at the beginning of a word transfer (HPI32) or the first half-word transfer (HPI16) on the falling edge of  $\overline{HSTROBE}$ , the HPI sends the request to the EDMA internal address generation hardware, and  $\overline{HRDY}$  remains high until the EDMA internal address generation hardware loads the requested data into HPID. For writes,  $\overline{HRDY}$  goes high if the internal write buffer is full.

| NO. | PARAMETER                                                                        | –50xEP |        | UNIT |
|-----|----------------------------------------------------------------------------------|--------|--------|------|
|     |                                                                                  | MIN    | MAX    |      |
| 15  | $t_{d(HSTBH-HDZH)}$ Delay time, $\overline{HSTROBE}$ high to HD high impedance   |        | 12     | ns   |
| 16  | $t_{d(HSTBL-HDV)}$ Delay time, $\overline{HSTROBE}$ low to HD valid (HPI16 only) |        | 4P + 8 | ns   |

- (1)  $\overline{HSTROBE}$  refers to the following logical operation on  $\overline{HCS}$ ,  $\overline{HDS1}$ , and  $\overline{HDS2}$ :  $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$ .

## 5.11 PERIPHERAL COMPONENT INTERCONNECT (PCI) TIMING (C6415 AND C6416 ONLY)

### 5.11.1 Timing Requirements for PCLK <sup>(1)</sup> <sup>(2)</sup>(see [Figure 5-36](#))

| NO. | PARAMETER                                          | –50xEP                     |     | UNIT |
|-----|----------------------------------------------------|----------------------------|-----|------|
|     |                                                    | MIN                        | MAX |      |
| 1   | $t_{c(PCLK)}$ Cycle time, PCLK                     | 30 (or 8P <sup>(3)</sup> ) |     | ns   |
| 2   | $t_{w(PCLKH)}$ Pulse duration, PCLK high           | 11                         |     | ns   |
| 3   | $t_{w(PCLKL)}$ Pulse duration, PCLK low            | 11                         |     | ns   |
| 4   | $t_{sr(PCLK)}$ $\Delta v/\Delta t$ slew rate, PCLK | 1                          | 4   | V/ns |

- (1) For 3.3-V operation, the reference points for the rise and fall transitions are measured at  $V_{ILP}$  MAX and  $V_{IHP}$  MIN.  
(2) P = 1/CPU clock frequency in ns. For example when running parts at 500 MHz, use P = 2 ns.  
(3) Select the parameter value of 30 ns or 8P, whichever is greater.

**Figure 5-36. PCLK Timing**

### 5.11.2 Timing Requirements for PCI Reset (see [Figure 5-37](#))

| NO. | PARAMETER                                                                   | –50xEP |     | UNIT    |
|-----|-----------------------------------------------------------------------------|--------|-----|---------|
|     |                                                                             | MIN    | MAX |         |
| 1   | $t_{w(PRST)}$ Pulse duration, $\overline{PRST}$                             | 1      |     | ms      |
| 2   | $t_{su(PCLKA-PRSTH)}$ Setup time, PCLK active before $\overline{PRST}$ high | 100    |     | $\mu$ s |

**Figure 5-37. PCI Reset ( $\overline{PRST}$ ) Timing**

### 5.11.3 Timing Requirements for PCI Inputs (see [Figure 5-38](#))

| NO. | PARAMETER                                                   | –50xEP |     | UNIT |
|-----|-------------------------------------------------------------|--------|-----|------|
|     |                                                             | MIN    | MAX |      |
| 1   | $t_{su(IV-PCLKH)}$ Setup time, input valid before PCLK high | 7      |     | ns   |
| 2   | $t_{h(IV-PCLKH)}$ Hold time, input valid after PCLK high    | 0      |     | ns   |

| NO. | PARAMETER                                                       | –50xEP |     | UNIT |
|-----|-----------------------------------------------------------------|--------|-----|------|
|     |                                                                 | MIN    | MAX |      |
| 1   | $t_d(PCLKH-OV)$ Delay time, PCLK high to output valid           |        | 11  | ns   |
| 2   | $t_d(PCLKH-OIV)$ Delay time, PCLK high to output invalid        | 2      |     | ns   |
| 3   | $t_d(PCLKH-OLZ)$ Delay time, PCLK high to output low impedance  | 2      |     | ns   |
| 4   | $t_d(PCLKH-OHZ)$ Delay time, PCLK high to output high impedance |        | 28  | ns   |

Figure 5-38. PCI Input/Output Timing

#### 5.11.5 Timing Requirements for Serial EEPROM Interface (see [Figure 5-39](#))

| NO. |                                                                 | -50xEP |     | UNIT |

| NO. |               |                              | –50xEP |     | UNIT |
|-----|---------------|------------------------------|--------|-----|------|
|     |               |                              | MIN    | MAX |      |
| 1   | $t_{w(GPIH)}$ | Pulse duration, GPIx high 8P | 8P     |     | ns   |
| 2   | $t_{w(GPIL)}$ | Pulse duration, GPIx low 8P  | 8P     |     | ns   |

(1) P = 1/CPU clock frequency in ns. For example, when running parts at 500 MHz, use P = 2 ns.

(2) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 12P to allow the DSP enough time to access the GPIO register through the CFGBUS.

| NO. | PARAMETER     |                           | –50xEP |     | UNIT |
|-----|---------------|---------------------------|--------|-----|------|

| 5   | R <sub>θJA</sub> Junction to free air    | 1.0                               | 13.4  | 7.35                                     |
| 6   | R <sub>θJA</sub> Junction to free air    | 2.00                              | 11.89 | 6.46                                     |
| 7   | Ψ <sub>iJT</sub> Junction to package top | N/A                               | 0.5   | 0.5                                      |
| 8   | Ψ <sub>iJB</sub> Junction to board       | N/A                               | 7.4   | 7.4                                      |

(1) m/s = meters per seconds

(2) These thermal resistance numbers were modeled using a heatsink, part number 374024B00035, manufactured by AAVID Thermalloy. AAVID Thermalloy also manufactures a similar epoxy-mounted heatsink, part number 374024B00000. TI recommends a passive, laminar heatsink, similar to the part numbers mentioned above.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

---

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product

GLZ (S-PBGA-N532)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Thermally enhanced plastic package with a lid.
  - D. Flip chip application only.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
