NCS603

NOCAP™, Pop-Free, 3 V_{RMS} Audio Line Driver with Adjustable Gain

The NCS603 is a pop−free stereo line driver. It uses ON Semiconductor's patented NOCAP technology which allows the elimination of the external DC−blocking capacitors by providing ground−referenced outputs through the generation of an internal negative supply rail. The device can drive 3 V_{RMS} into a 600 Ω load at 5 V power supply. By eliminating the two external heavy coupling capacitors, the NOCAP approach offers significant space and cost savings compared to similar audio solutions.

The NCS603 has differential inputs and is available with an external adjustable gain ranging from ±1 V/V to ±10 V/V. The gain is adjusted with external resistors. The device can also be configured as a 2nd order low pass filter to complement DAC's and SOC converters. In addition to the NOCAP architecture, it contains specific circuitry to prevent "Pop & Click" noise from occurring during Enable / Shutdown transitions. The Signal-to-Noise Ratio reaches 105 dB, offering high fidelity audio sound. The NCS603 exhibits a high power supply rejection with a typical value of 90 dB. This device also features an Under−Voltage Protection (UVP) function which can be adjusted using an external resistor bridge. The device is available in a TSSOP−14 package.

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 13 of this data sheet.

Features

- NOCAP
  - Eliminates Pop/Clicks
  - Eliminates Output DC−Blocking Capacitors – Provides Flat Frequency Response 20 Hz – 20 kHz
- Supply Voltage from 2.2 V to 5.5 V
- Low Noise and THD
  - SNR = 105 dB
  - Typical V_n at 8 μVrms, A−Weighted
  - THD+N < 0.001% at 1 kHz
- Output Voltage into 600 Ω Load
  - 2 V_{RMS} with 3.3 V Supply Voltage
  - 3 V_{RMS} with 5 V Supply Voltage
- Adjustable Gain from ± 1 V/V to ± 10 V/V
- Differential Input
- High PSRR: 90 dB
- External Under−Voltage Detection Function
- Enhanced Pop & Click Suppression Function
- Offset Voltage ≤ ±400 μV
- Outputs pass ±8 kV contact discharge according to IEC61000−4−2 under application conditions
- Available in a TSSOP−14 package
- These Devices are Pb−Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Set−Top Boxes
- PDP / LCD TV
- Blu−ray™ Player, DVD Players
- Home Theater in a Box
- Laptops, Notebook PCs

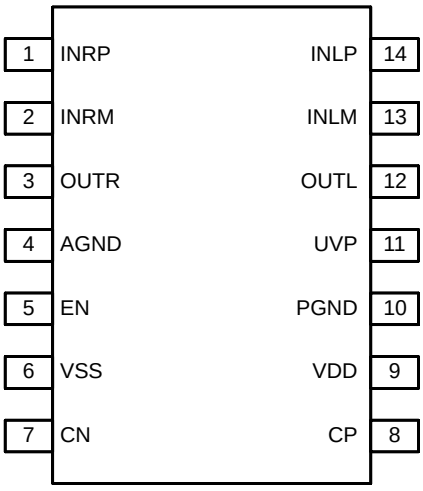

Figure 2. NCS603, Pinout

PIN FUNCTION AND DESCRIPTION

Pin	Name	Type	Description
1	INRP	Input	Right channel positive input
2	INRM	Input	Right channel negative input
3	OUTR	Output	Right channel output
4	AGND	Ground	Analog ground. Connect to PGND
5	EN	Input	Enable pin. Active High
6	VSS	Power	Negative rail output. Connected to ground through 1 μF low ESR ceramic reservoir capacitor.
7	CN	−	Flying capacitor Negative terminal. Connected to CP through 1 μF low ESR ceramic capacitor.
8	CP	−	Flying capacitor Positive terminal. Connected to CN through 1 μF low ESR ceramic capacitor.
9	VDD	Power	Power Supply Input
10	PGND	Ground	Power ground
11	UVP	Input	Under−voltage detection pin.
12	OUTL	Output	Left Channel Output
13	INLM	Input	Left channel negative input
14	INLP	Input	Left channel positive input

ABSOLUTE MAXIMUM RATINGS (Note 1)

Parameter		Symbol	Value	Unit
Supply Voltage, VDD to GND		V_{DD}	−0.3 to 5.5	V
Input Voltage		V_I	V_{SS} – 0.3 to V_{DD} + 0.3	V
Minimum Load Impedance		R_L	>600	Ω
Logic Pin Voltage (EN)			–0.3 to V_{DD} +0.3	V
Maximum Junction Temperature		$T_{J(max)}$	−40 to 150	°C
Storage Temperature Range		T_{STG}	−40 to 150	°C
ESD Capability (Note 2)	Human Body Model Machine Model	ESD_{HBM} ESD_{MM}	2000 200	V
Latch−up Current (Note 3)		I_{LU}	100	mA
Moisture Sensitivity Level (Note 4)		MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
   ESD Human Body Model tested per AEC−Q100−002 (JEDEC standard: JESD22−A114)
   ESD Machine Model tested per AEC−Q100−003 (JEDEC standard: JESD22−A115)
3. Latch−up Current tested per JEDEC standard: JESD78
4. Moisture Sensitivity Level tested per IPC/JEDEC standard: J−STD−020A

THERMAL CHARACTERISTICS

Parameter	Symbol	Value	Unit
Junction−to−Ambient Thermal Resistance, TSSOP−14 (Note 5)	θ_{JA}	115	°C/W

5. Values based on copper area of 645 mm^2 (or 1 in^2) of 1 oz copper thickness and FR4 PCB substrate.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Unit
Supply Voltage with UVP connected to Ground	V_{DD}	2.2	3.3	5.5	V
High−Level Input Voltage	V_{IH} (EN)	1.2			V
Low−Level Input Voltage	V_{IL} (EN)			0.4	V
Ambient Temperature	T_A	−40		85	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

ELECTRICAL CHARACTERISTICS, T_A = 25°C (unless otherwise noted)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Output Offset Voltage	$\|V_{OS}\|$	V_{DD} = 2.5 V to 5 V, Voltage follower − gain = 1		100	400	μV
High−Level Input Current (EN)	$\|I_{IH}\|$	V_{DD} = 5 V, V_I = V_{DD}			100	nA
Low−Level Input Current (EN)	$\|I_{IL}\|$	V_{DD} = 5 V, V_I = 0 V			100	nA
Supply Current	I_{DD}	V_{DD} = 2.2 V, No load, EN = V_{DD}		7	11	mA
		V_{DD} = 5.5 V, No load, EN = V_{DD}		8	11	mA
		Shutdown mode, V_{DD} = 2.2 V to 5.5 V		15	25	μA
Under−Voltage Protection (UVP) Threshold	V_{UVP}			1.25		V
UVP Internal Hysteresis Current Source	I_{HYS}			5		μA
Charge Pump Frequency	f_{cp}			400		kHz

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

OPERATING CHARACTERISTICS

APPLICATION INFORMATION

DESCRIPTION

The NCS603 is a stereo line driver with a NOCAP architecture. This architecture eliminates the need to use two large, external capacitors required by conventional audio line driver applications. The NCS603 is basically composed of two true ground amplifiers with internal power supply rail, one UVP−circuit block, and short−circuit protection. The gain of the NCS603 can be adjusted with two external resistors.

The NOCAP approach is a patented architecture that requires only two 1 μF low ESR ceramic capacitors (fly capacitor and reservoir capacitor). It generates a symmetrical positive and negative voltage and it allows the output of the amplifiers to be biased around the ground (True Ground).

The NCS603 includes a special circuitry for eliminating any pop and click noise during turn on and turn off time. This circuitry combined with the true ground output architecture and a trimmed output offset voltage makes the elimination of pop and click particularly efficient.

UNDER−VOLTAGE PROTECTION (UVP) PIN MANAGEMENT

The UVP pin can be used to shut down the audio line driver by monitoring the board's main power supply. Then the line driver can be shut down before upstream devices disable, contributing this way to eliminate potential source of pop noise.

The device shuts down when the UVP voltage goes below 1.25 V typically. To monitor the lower main power supply limit, an external voltage divider constituted with three resistors, RUP, RDW and RHYS is used (Figure 21). Resistors values have to be chosen based on the requested power supply shutdown threshold and hysteresis for a given application. It is recommended to have RHYS >> RDW // RUP. RHYS is optional in the case where hysteresis is not necessary.

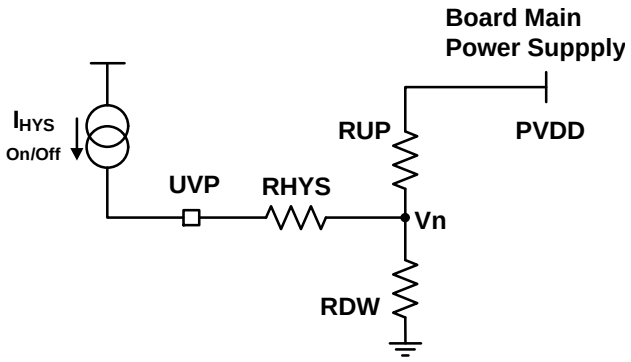

Figure 21. Voltage Divider Connected to UVP for Power Supply Monitoring

When the resistor divider is connected to the pin UVP as shown in Figure 21, the UVP pin voltage is a function of PVDD and I_{HYS} according to the below equation:

$$V_{UVP} = PVDD \times \frac{RDW}{RDW + RUP} + \left(RHYS \times \frac{RDW \times RUP}{RDW + RUP}\right) \times I_{HYS} \quad \text{(eq. 1)}$$

With V_{UVPth} = 1.25 V and I_{HYS} = 5 μA

This gives a PVDD Shutdown threshold.
PVDD Shutdown Threshold:

$$PVDD_{SD} = V_{UVPth} \times \frac{RDW + RUP}{RDW} - I_{HYS} \times \left(RHYS + \frac{RDW \times RUP}{RDW + RUP}\right) \times \frac{RDW + RUP}{RDW} \quad \text{(eq. 2)}$$

Simplified PVDD Shutdown threshold assuming RHYS >> RDW // RUP:

$$PVDD_{SD} = \left(V_{UVPth} - I_{HYS} \times RHYS\right) \times \frac{RDW + RUP}{RDW} \quad \text{(eq. 3)}$$

The PVDD Startup threshold is given by the below equation.
PVDD Hysteresis:

$$PVDD_{UP} = V_{UVPth} \times \frac{RDW + RUP}{RDW} \quad \text{(eq. 4)}$$

The hysteresis component is:
PVDD Hysteresis:

$$\Delta PVDD = V_{HYS} = I_{HYS} \times \left(RHYS + \frac{RDW \times RUP}{RDW + RUP}\right) \times \frac{RDW + RUP}{RDW}$$

$$= I_{HYS} \times \left(RHYS + \frac{RDW \times RUP}{RDW} + RUP\right) \times \frac{PVDD_{UP}}{V_{UVPth}} \quad \text{(eq. 5)}$$

Simplified PVDD Hysteresis assuming RYS >> RDW // RUP:

$$\Delta PVDD = V_{HYS} = I_{HYS} \times RHYS \times \frac{RDW + RUP}{RDW} = I_{HYS} \times RYS \times \frac{PVDD_{UP}}{V_{UVPth}} \quad \text{(eq. 6)}$$

For a given PVDD threshold RUP will be a function of RDW.
RUP and RDW:

$$RUP = \left(\frac{PVDD_{UP}}{V_{UVPth}} - 1\right) \times RDW \quad \text{(eq. 7)}$$

According to Equation 6, assuming RHYS >> RDW // RUP, and for a given hysteresis V_{HYS} and PVDD threshold, RHYS is:
RHYS

$$RHYS = \frac{V_{HYS} \times V_{UVPth}}{I_{HYS} \times PVDD_{UP}} = \frac{1.25 \times V_{HYS}}{5\ \mu A \times PVDD_{UP}} \quad \text{(eq. 8)}$$

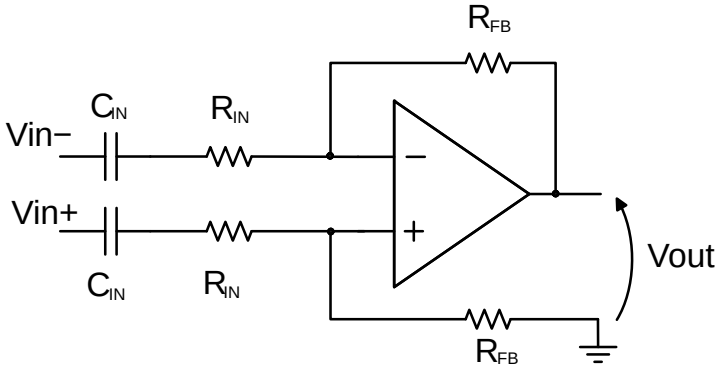
For example, to get $PVDD_{SD}$ = 2.5 V and 0.625 V hysteresis,
Power Divider Resistors have to be: RUP = 1.5 kΩ, RDW = 1 kΩ and RHYS = 51 kΩ

GAIN SETTING RESISTOR SELECTION (R_{IN} and R_{FB})

R_{IN} and R_{FB} set the closed−loop gain of the amplifier. The resistor values have to be chosen so that amplifier stability is preserved. A low gain configuration (close to 1) minimizes the THD + noise values and maximizes the signal to noise ratio.

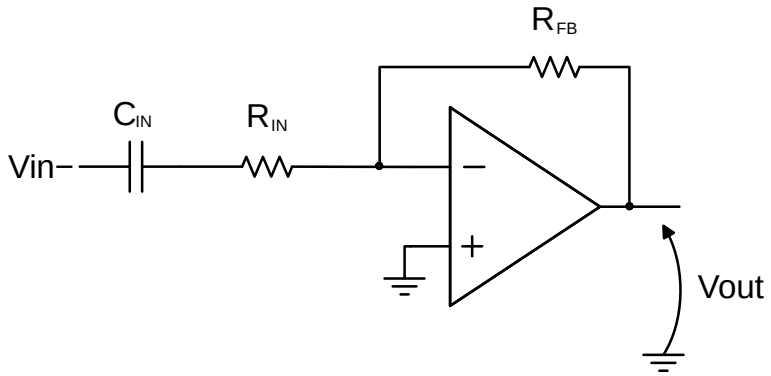
A closed−loop gain in the range of 1 to 10 is recommended to optimize overall system performance.

Selecting values that are too low requires a relatively large input ac-coupling capacitor, C_{IN}. Selecting values that are too high increases the overall noise of the amplifier.



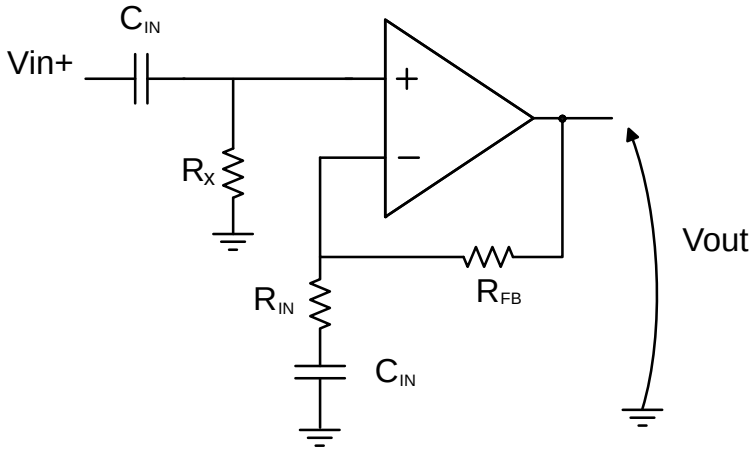
$$Av = \frac{Vout}{Vin+ - Vin-} = \frac{R_{FB}}{R_{in}} \quad \text{(eq. 9)}$$

Figure 22. Differential Input Gain Configuration



$$Av = \frac{Vout}{Vin-} = \frac{-R_{FB}}{R_{IN}} \quad \text{(eq. 10)}$$

Figure 23. Inverting Gain Configuration



$$Av = \frac{V_{out}}{Vin+} = 1 + \frac{R_{FB}}{R_{IN}} \quad \text{(eq. 11)}$$

Figure 24. Non−Inverting Gain Configuration

Table 1. RECOMMENDED RESISTOR VALUES

Input Resistor Value, R_{IN}	Feedback Resistor Value, R_{FB}	Differential Input Gain	Inverting Input Gain	Non Inverting Input Gain
22 kΩ	22 kΩ	1.0 V/V	–1.0 V/V	2.0 V/V
22 kΩ	33 kΩ	1.5 V/V	–1.5 V/V	2.5 V/V
33 kΩ	68 kΩ	2.06 V/V	–2.06 V/V	3.1 V/V
10 kΩ	100 kΩ	10.0 V/V	–10.0 V/V	11.0 V/V

INPUT CAPACITOR

The input coupling capacitor blocks the DC voltage at the amplifier input terminal. This capacitor creates a high−pass filter with R_{IN}. The size of the capacitor must be large enough to couple at low frequencies without severe attenuation in the audio bandwidth (20 Hz − 20 kHz).

The cut off frequency for the input high−pass filter is:

$$f_c = \frac{1}{2\pi R_{in} C_{in}} \quad \text{(eq. 12)}$$

A f_c < 20 Hz is recommended.

CHARGE PUMP CAPACITOR SELECTION

It is recommended to use ceramic capacitors with low ESR for better performances. X5R or X7R capacitors are recommended. The flying capacitor C_{fly} (1 μF) serves to transfer charge during the generation of the negative voltage. The VSS reservoir capacitor C_{VSS} must be equal at least to the C_{fly} capacitor to allow maximum charge transfer. The 1 μF capacitors have to be connected as close as possible to the corresponding pins.

Lower value capacitors can be used but the device may not operate to specifications.

POWER SUPPLY DECOUPLING CAPACITORS

The NCS603 is a True Ground amplifier that requires an adequate decoupling capacitor on VDD to reduce noise and THD+N. Use a X5R / X7R ceramic capacitor and place it close to the VDD pin. A value of 1μF is recommended. For filtering lower frequency noise signals, a 10 μF or greater capacitor placed near the audio power amplifier would also help.

SHUTDOWN FUNCTION

The device enters shutdown mode when Enable signal is low. During the shutdown mode, the internal charge pump is shut down, and the DC quiescent current of the circuit does not exceed 500 nA. The output is pulled to ground through a low output impedance of about 40 ohms.

USING THE NCS603 AS A 2nd ORDER FILTER

Audio DACs can require an external low-pass filter to remove out-of-band noise. This is possible with the NCS603, which can be used as a standard Operational Amplifier with the advantage of better performances including “pop & click” noise behavior.

Single-ended and differential topologies can be implemented. In Figures 25 and 26, a Multiple-FeedBack (MFB) topoplogy, with differential inputs and single-ended inputs is shown. The two topologies use AC-Coupling capacitors (C_{IN}) to block the DC-signal component coming from the source; they contribute to reducing the output offset voltage.

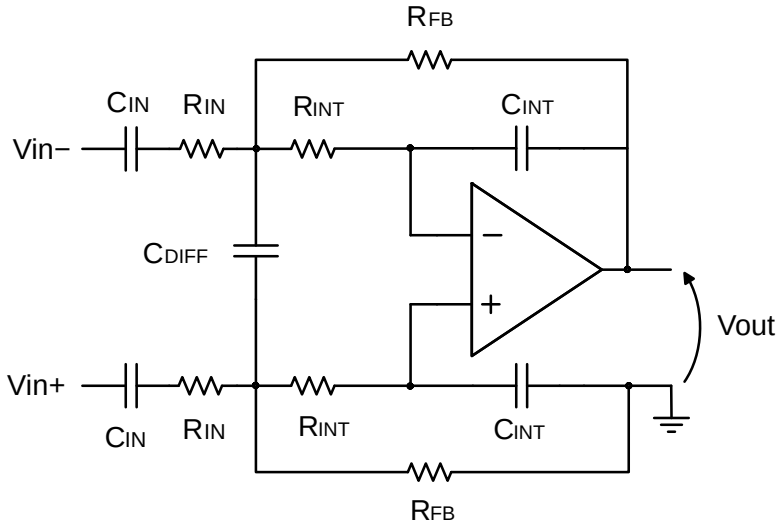


Figure 25. 2nd Order Active Low Pass Filter − Differential Input

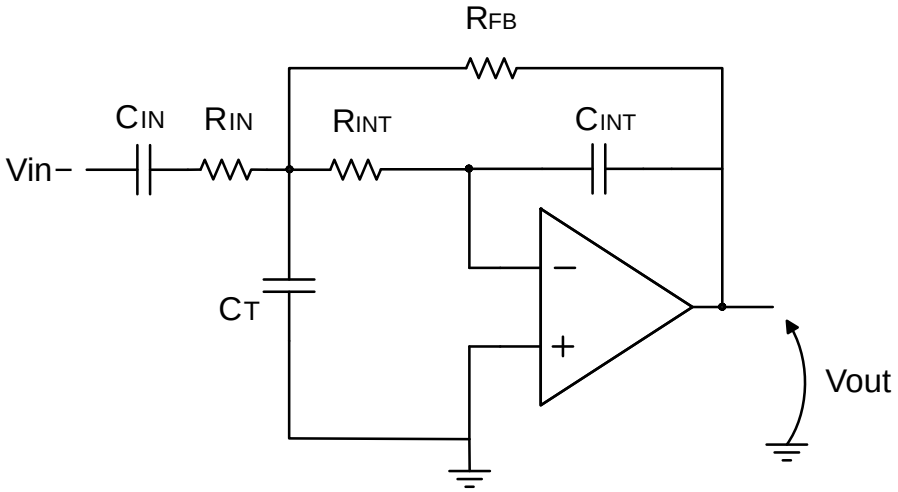

Figure 26. 2nd Order Active Low Pass Filter − Inverting Input

INITIALIZATION AND POP−FREE POWER UP/DOWN

For an on/off/on power sequence, VDD is required to be ramped down to 0 V before ramping back up for power on (shown in Figure 27). This ensures that the NCS603 internal circuits are properly initialized to guarantee an optimal output.

Pop−free power−up/−down is ensured by keeping EN (Enable pin) low during power supply ramp−up or ramp−down. The EN pin should be kept low until the input ac−coupling capacitors are fully charged before asserting the EN pin high; this way, proper pre−charge of the ac−coupling is performed, and pop−free power−up is achieved. Figure 27 illustrates the preferred sequence.

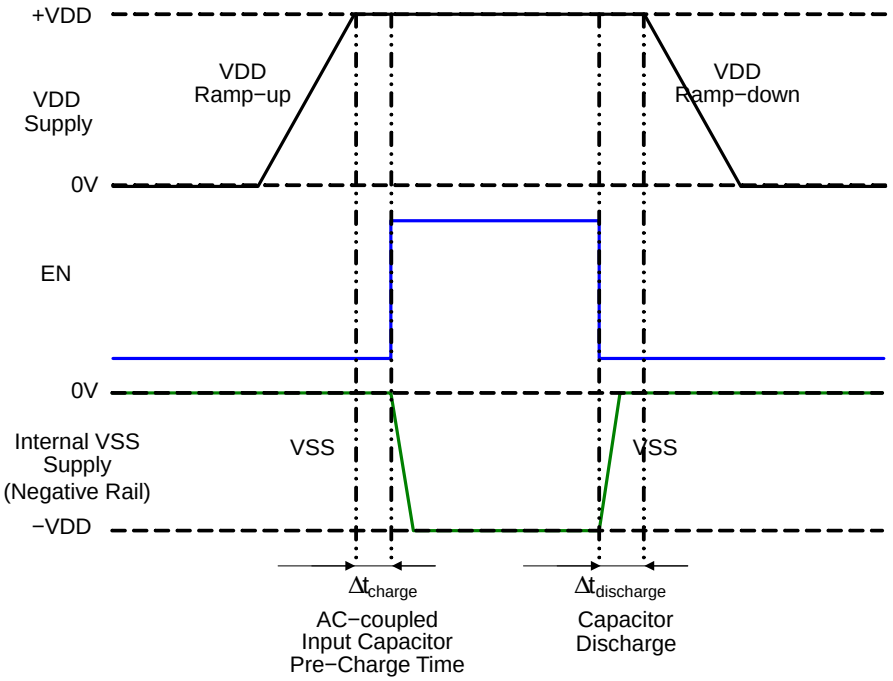

Figure 27. Initialization and Power Up/Down Sequence

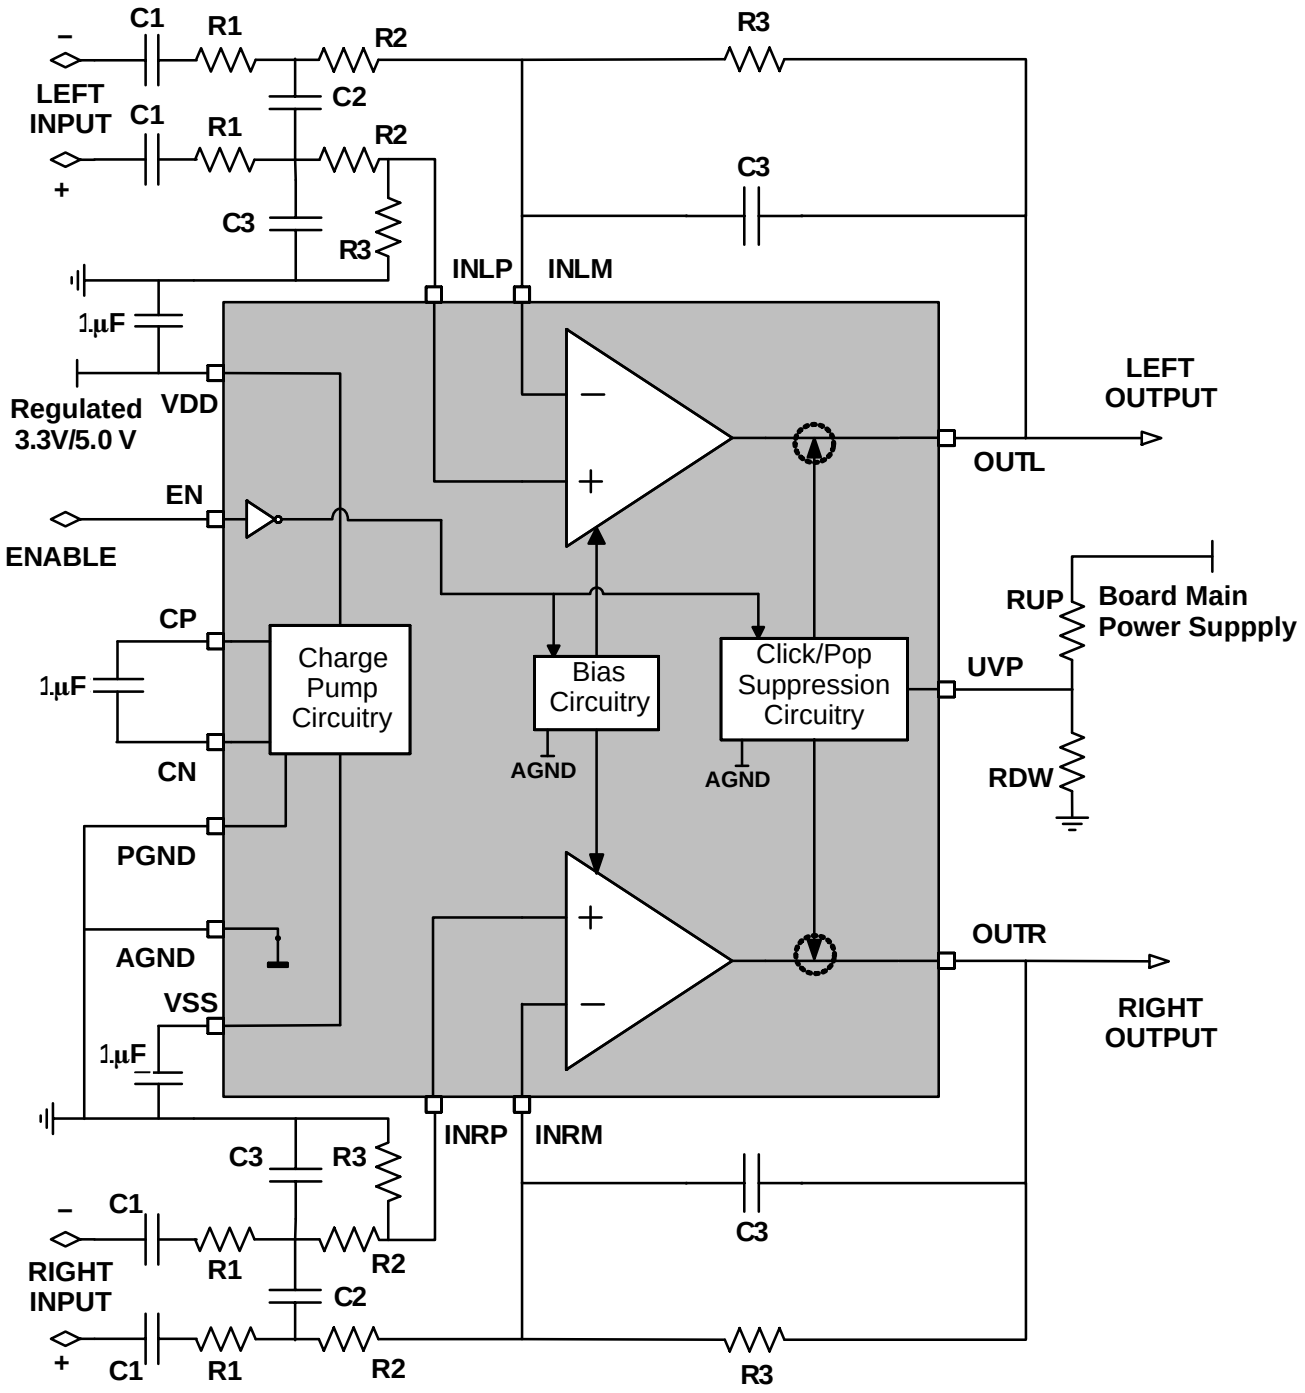
CAPACITIVE LOAD

The NCS603 has the ability to drive a high capacitive load up to 220 pF directly. Higher capacitive loads can be accepted by adding a series resistor of 10 Ω or larger.

ESD PERFORMANCE

From the system level perspective, the outputs of the NCS603 are rated to Level 4 of the IEC61000−4−2 ESD standard. Using the contact discharge method, the outputs pass a ±8 kV discharge with an RC network of R = 33 ohms and C = 1 nF at each output to simulate the application environment.

APPLICATION SCHEMATIC



R1 = R2 = R3 = 5.6 kΩ, C1 = 100 nF, C2 = 470 pF, C3 = 220 pF
