## MSL3163 and MSL3164

16-string White & RGB LED Drivers with Adaptive Power Control, E<sup>2</sup>PROM, and SPI/I<sup>2</sup>C/SMBus Serial Interface

### Datasheet Brief

# Atmel LED Drivers-MSL3163 and MSL3164

16-string White & RGB LED Drivers with Adaptive Power Control, E<sup>2</sup>PROM, and SPI/I<sup>2</sup>C/SMBus Serial Interface

## General Description

The Atmel LED Drivers-MSL3163 and MSL3164 compact, high-power LED string drivers use internal current control MOSFETs to sink up to 100mA per string, with current accuracy and matching better than 3%. The MSL3163/4 drive 16 parallel strings of ten white LEDs each, for a total of 160 white LEDs per device. Sixteen interconnected devices control up to 2560 white LEDs.

The MSL3163/4 adaptively controls the DC-DC converters that power the LED strings, using Atmel's Adaptive SourcePower technology. These Efficiency Optimizers minimize power use while maintaining LED current accuracy.

The MSL3164 features a 20 MHz SPI serial interface, and the MSL3163 offers a 1 MHz I<sup>2</sup>C serial interface. Both interfaces support video frame-by-frame LED string intensity control for up to 16 interconnected devices to allow active area dimming. The devices include an advanced PWM engine that easily synchronizes to a video signal, and per-string phase adjustment to reduce unwanted LCD artifacts such as motion blur. Additionally, an on-chip E<sup>2</sup>PROM allows the power-up defaults to be customized through the serial interface.

A unique combination of peak current control and pulse width management offer simple full screen brightness control, versatile area dimming and a consistent white point. One external resistor provides the global peak reference current for all LED strings, and global peak current fine-tuning is available through an 8-bit register. Global string drive pulse width is adjusted with an 8-bit global intensity register, and individual string pulse width is modulated with 12-bit registers.

The MSL3163/4 feature fault monitoring of open circuit, short circuit, loss of video sync and over temperature conditions, and provides a fault output to notify the system controller. Detailed fault status and control are available through the serial interface.

The MSL3163/4 are offered in a 6 x 6 x 0.75mm, 40-pin TQFN package and operate over the -40°C to 85°C temperature range.

## Applications

### Long Life, Efficient LED Backlighting For:

- Televisions and Desktop Monitors
- Medical and Industrial Instrumentation
- Automotive Audio-visual Displays

### Channel Signs

### Architectural Lighting

# Atmel LED Drivers-MSL3163 and MSL3164

16-string White & RGB LED Drivers with Adaptive Power Control, E<sup>2</sup>PROM, and SPI/I<sup>2</sup>C/SMBus Serial Interface

## Key Features

- 12-bit PWM String Dimming Operates at 240Hz
- Fast Serial Interfaces Support up to 16 Devices per Bus:
  - MSL3164 20 MHz SPI
  - MSL3163 1 MHz I<sup>2</sup>C
- 8-bit Adaptive Power Correction Maximizes Efficiency of up to Three String Power Supplies
- Drives 16 Parallel LED Strings of 10 White LEDs Each for up to 2560 White LEDs per Serial Bus
- Supports Adaptive, Real-time Area Dimming for Highest Dynamic Range LCD TVs and Monitors
- Programmable String Phase Reduces Motion Blur
- Global Intensity Control via Serial Interface
- 100mA Peak, 60mA Average LED String Current
- Single Resistor Sets Peak Current for all LED Strings
- $\pm 3\%$  Current Accuracy and Current Balance
- Video Frame (VSYNC) and Line (HSYNC) Sync Inputs
- Sync Loss Detectors Optionally Disable LED Strings
- Multiple MSL3163/4s Share String Power Supplies and Automatically Negotiate the Optimum Supply Voltage
- E<sup>2</sup>PROM Allows Customized Power-On Defaults
- Less Than 1 $\mu$ A LED String Off-Leakage Current
- String Open Circuit and LED Short Circuit Fault Detection
- Individual Fault Detection Enable for Each String
- Over-temperature Shutoff Protection
- Broadcast Write Simplifies Configuration
- -40°C To +85°C Operating Temperature Range

| 36  | VDD      | VDD     | <b>2.5V internal LDO regulator output</b><br>VDD powers internal logic. Bypass VDD to GND with a 4.7μF ceramic capacitor placed close to VDD.                                                                                                                                   |
| 37  | NC       | NC      | <b>No connect</b><br>Leave NC unconnected.                                                                                                                                                                                                                                      |
| 38  | FBO1     | FBO1    | <b>Efficiency Optimizer output 1</b><br>Connect FBO1 to the first power supply's feedback node or to FBI1 of the previous device when chaining devices (Figure 7). If unused connect FBO1 to GND.                                                                               |
| 39  | FBI1     | FBI1    | <b>Efficiency Optimizer input 1</b><br>Connect FBI1 to FBO1 of the next device when chaining devices (Figure 7). If unused connect FBI1 to GND.                                                                                                                                 |
| 40  | FBO2     | FBO2    | <b>Efficiency Optimizer output 2</b><br>Connect FBO2 to the second power supply's feedback node or to FBI2 of the previous device when chaining devices (Figure 7). If unused connect FBO2 to GND.                                                                              |
| EP  | EP       | EP      | <b>Exposed pad, power ground</b><br>EP is the path that the string currents take to ground. EP also provides thermal relief for the die. Provide large traces from EP back to the string power supplies. Also connect EP to system ground, and to GND using short, wide traces. |

## Absolute Maximum Ratings

### Voltage (With Respect to GND, CGND = EP = GND)

|                                                        |                       |
|--------------------------------------------------------|-----------------------|
| VIN, EN .....                                          | -0.3V to +6V          |
| VDD.....                                               | -0.3V to +2.75V       |
| MSL3163: SDA, SCL .....                                | -0.3V to +6V          |
| MSL3164: MISO, MOSI, CSB, SCK .....                    | -0.3V to (VIN + 0.3V) |
| FLTB .....                                             | -0.3V to +6V          |
| ILED, AD0, AD1.....                                    | -0.3V to (VDD + 0.3V) |
| PHI, GSC, PWM, FBO1, FBO2, FBO3, FBI1, FBI2, FBI3..... | -0.3V to (VIN + 0.3V) |
| STR0 thru STR15 .....                                  | -0.3V to +40V         |
| CGND.....                                              | -0.3V to +0.3V        |

### Current (Into Pin)

|                       |         |
|-----------------------|---------|
| VIN.....              | 50mA    |
| EP.....               | -1700mA |
| STR0 thru STR15 ..... | 105mA   |
| All other pins.....   | 20mA    |

### Continuous Power Dissipation

|                                                                                                 |                 |
|-------------------------------------------------------------------------------------------------|-----------------|
| 40-Pin 6mm x 6mm QFN (derate 37mW/°C above T <sub>A</sub> = +70°C) .....                        | 2963mW          |
| Ambient Operating Temperature Range T <sub>A</sub> = T <sub>MIN</sub> to T <sub>MAX</sub> ..... | -40°C to +85°C  |
| Junction Temperature .....                                                                      | +125°C          |
| Storage Temperature Range .....                                                                 | -65°C to +125°C |
| Lead Soldering Temperature, 10s .....                                                           | +300°C          |

## Electrical Characteristics

(Typical Application Circuit, VIN = 5V, TA = TMIN to TMAX, unless otherwise noted. Typical values are at VIN = 5V, TA = +25°C).

Note 1. Subject to thermal dissipation characteristics of the device

Note 2. Guaranteed by design, not production tested.

Note 3. Minimum SCL clock frequency is limited by the bus timeout feature, which resets the serial bus interface if either SDA or SCL is held low for  $t_{\text{timeout}}$ . Disable bus timeout via the Power Control register 0x02[6].

Note 4.  $t_{\text{VD,ACK}}$  = SCL LOW to SDA (out) LOW acknowledge time.

Note 5.  $t_{\text{VD,DAT}}$  = minimum SDA output data-valid time following SCL LOW transition.

Note 6. A master device must internally provide an SDA hold time of at least 300ns to ensure an SCL low state.

Note 7. The maximum SDA and SCL rise times is 300ns. The maximum SDA fall time is 250ns. This allows series protection resistors to be connected between SDA and SCL inputs and the SDA/SCL bus lines without exceeding the maximum allowable rise time.

Note 8. MSL3163/4 includes input filters on SDA, SCL, AD0 and AD1 inputs that suppress noise less than 50ns.

16-string White & RGB LED Drivers with Adaptive Power Control, E<sup>2</sup>PROM, and SPI/I<sup>2</sup>C/SMBus Serial Interface

## Detailed Description

The MSL3163 and MSL3164 are highly integrated, flexible multi-string LED drivers with power supply control to maximize system efficiency. The drivers easily connect to a video subsystem. Although optional, this offers a simple architecture for use in LCD TV backlight applications. Up to 16 drivers easily connect together to drive large numbers of LED strings in a system. The drivers provide multiple methods of controlling LED brightness, through both peak current control and through pulse width control of the string drive signals. Peak current control offers excellent color consistency, while pulse width control allows brightness management. An on-chip E<sup>2</sup>PROM holds all the default control register values. At power-up the data in the E<sup>2</sup>PROM automatically copy directly to the control registers, setting up the device for operation.

The devices interface to a  $\mu$ C via I<sup>2</sup>C (MSL3163) or SPI (MSL3164). The robust 1MHz I<sup>2</sup>C interface supports up to 16 devices on the bus. The 20MHz bus addressable SPI interface supports up to 16 devices per Chip Select line. While typically the LED drive PWM signal is internally generated, both drivers also accept an external direct-drive PWM signal and offer optional string drive phase spreading. With direct-drive PWM, a Pulse Width Modulated signal applied to the PWM input sets the PWM duty and the frequency of the LEDs drive signal. With phase spreading enabled, a progressive 1/16 PWM-frame time delay per string helps reduce both the transient load on the LED power supplies, and the power supply input capacitor size requirements.

The PWM frequency of the drivers is either synchronized to an external signal applied to PHI, or generated from the internal oscillator for stand-alone applications. Typically the VSYNC signal from the video system is used for the PHI input. The on-time of each string is individually programmed via the device registers, providing a peak resolution of 12-bits when using the on-chip PWM generator. The actual resolution of the PWM frequency depends upon on the ratio of the GSC frequency (typically provided by a systems HSYNC signal, but can

be internally generated) to the PHI frequency, because the on-time of a string is programmed as a 12-bit count of the number of GSC clock cycles. This count can be further scaled by an 8-bit Global intensity value, when enabled. The GSC clock is also used to precisely set each string's phase delay so that it is synchronized relative to the video frame.

The Efficiency Optimizers control a wide range of different architectures of external DC/DC and AC/DC converters. Multiple drivers in a system communicate with each other in real time to select an optimized operating voltage for the LEDs. This allows design of the power supply for the worst case Forward Voltage ( $V_f$ ) of the LEDs without worrying about excessive power dissipation issues. During the start-up sequence the MSL3163/4 automatically reduce the power supply voltage to the minimum voltage required to keep the LEDs in current regulation. The devices can be configured to periodically perform this optimization to compensate for changes of the LED's forward voltage, and to assure continued optimum power savings.

## Internal Regulators and Enable Input

The MSL3163/4 includes an internal linear regulator that operates from the 5V nominal input supply, VIN, and provides an internal 2.5V supply, VDD, to power the low-voltage internal circuitry. Bypass VDD (pin 36) to GND with a 4.7 $\mu$ F capacitor. Bypass VIN (pin 35) to GND with a 10 $\mu$ F capacitor.

The MSL3163/4 enable input, EN, enables the device. Drive EN low to enter low power operation, which lowers quiescent current draw to less than 20 $\mu$ A. With EN low the serial interface is ignored. Drive EN high to turn on the device. When EN is driven high the contents of the E<sup>2</sup>PROM are boot-loaded into the control registers, simulating a cold start-up.

## Setting the LED String Current with $R_{ILED}$ and ISTR

The MSL3163/4 features 16 current sink outputs, rated at 40V, each designed to sink up to 100mA peak. Limit average current to 60mA if the PCB copper around the MSL3163/4 is the only heat sink employed. The maximum string current,  $I_{ILED}$ , for all 16 LED string inputs is set by a single external resistor,  $R_{ILED}$ , placed from ILED to GND, whose value is determined using:

$$R_{ILED} = \frac{762}{I_{ILED}}$$

For example, a full-scale LED current of 60mA returns  $R_{ILED} = 12.7k\Omega$ . The current for all LED strings is reduced from its full-scale value with 8-bit resolution using ISTR, the String Current Control register 0x0F.

## Connecting the Efficiency Optimizer to an LED String Power Supply and Selecting Resistors

The MSL3163/4 are designed to control LED string power supplies that use a voltage divider ( $R_{TOP}$  and  $R_{BOTTOM}$  in Figure 6) to set output voltage, and whose regulation feedback voltage is not more than 3.5V. The Efficiency Optimizer improves power efficiency by injecting a current of between 0 $\mu$ A and 255 $\mu$ A into the voltage divider of the external power supply, dynamically adjusting the power supply's output to the minimum voltage required by the LED strings. To select the resistors first determine  $V_{OUT(MIN)}$  and  $V_{OUT(MAX)}$ , the minimum and maximum string supply voltage limits, using:

$$V_{OUT(MIN)} = (V_{f(MIN)} * [\#ofLEDs]) + 0.5 ,$$

and

$$V_{OUT(MAX)} = (V_{f(MAX)} * [\#ofLEDs]) + 0.5 ,$$

where  $V_{f(MIN)}$  and  $V_{f(MAX)}$  are the LED's minimum and maximum forward voltage drops at the peak current set by  $R_{LED}$  (page 10). For example, if the LED data are  $V_{f(MIN)} = 3.5V$  and  $V_{f(MAX)} = 3.8V$ , and ten LEDs are used in a string, then the total minimum and maximum voltage drops across the LEDs are 35V and 38V. Adding an allowance of 0.5V of for the string drive MOSFET headroom brings  $V_{OUT(MIN)}$  to 35.5V and  $V_{OUT(MAX)}$  to 38.5V. Do not to exceed the 40V maximum specification of the string drivers STR1 thru STR15. Then determine  $R_{TOP}$  using:

$$R_{TOP} = \frac{V_{OUT(MAX)} - V_{OUT(MIN)}}{I_{FBO n(MAX)}} ,$$

where  $I_{FBO n(MAX)}$  is the 255 $\mu$ A maximum output current of the Efficiency Optimizer outputs FBO<sub>n</sub> (if cascading multiple MSL3163/4s determine  $I_{FBO n(MAX)}$  as shown in the next section). Finally, determine  $R_{BOTTOM}$  using:

$$R_{BOTTOM} = R_{TOP} * \frac{V_{FB}}{V_{OUT(MAX)} - V_{FB}} ,$$

where  $V_{FB}$  is the regulation feedback voltage of the power supply. Place a diode (1N4148 or similar) between FBO<sub>n</sub> and the supply's feedback node to protect the MSL3163/4 against current flow into FBO<sub>n</sub>.

## Using Multiple Atmel LED Drivers-MSL3163/4s to Control a Common Power Supply

Cascade multiple MSL3163/4 devices into a chain configuration, with the FBIn of one device connected to the FBO<sub>n</sub> of the next (Figure 7). Connect the first FBO<sub>n</sub> to the power supply feedback resistor node through a diode, and the unused FBIn inputs (and any unused FBO<sub>n</sub> outputs) to GND as close to the MSL3163/4 as possible. Assign all strings powered by a common supply to the proper FBO<sub>n</sub> output using String Set registers (STRnSET) 0x20 thru 0x3F. The chained devices work together to ensure that the system operates at optimum efficiency. Note that the accuracy of the feedback chain may degrade through each link of the FBIn/FBO<sub>n</sub> chain by as much as 2%. Determine the potential worst case maximum FBO<sub>n</sub> current  $I_{FBO n(MAX/MIN)}$  using:

$$I_{FBO n(MAX / MIN)} = 255\mu A * (0.98)^{N-1} ,$$

where N is the number of MSL3163/4s connected in series. Use this result in the above  $R_{TOP}$  resistor equation for the term  $I_{FBO n(MAX)}$  instead of using 255 $\mu$ A.

Take care in laying out the traces for the Efficiency Optimizer connections. Minimize the FBIn/FBO<sub>n</sub> trace lengths as much as possible. Do not route the signals close to traces with large variations in voltage or current, because noise may couple into FBIn. If these traces must be routed near noisy signals, shield them from noise by using ground planes or guard traces.

**Figure 7. Example of Cascading Multiple Devices to Optimize Common Power Supplies**

### Direct PWM Control of the LED Strings

An external PWM signal applied to the PWM input allows direct PWM control over the strings when bits PWMEN and PWMDIRECT are set in PWM Control register 0x1E. This configuration bypasses PHI and GSC, but allows automatic LED string phase delay using bit D2 of register 0x1E.

The PWM input can also be configured as a gate for the output of the PWM engine using the PWM Global Enable bit D3 of the PWM Control register 0x1E.

## Register Map and the E<sup>2</sup>PROM

### Register Map Summary

Control the MSL3163/4 using the 96 registers in the range 0x00 thru 0x5F (Table 2). It may be convenient, and it is allowed, to read and write to unused bits in this range when accessing registers, but always write zeros. Reads from unused bits always return zeros. Three additional registers, 0x90, 0x91 and 0x93 allow access to the E<sup>2</sup>PROM and provide Efficiency Optimizer status. The power-up default values for all control registers are stored within the on-chip E<sup>2</sup>PROM, and any of these E<sup>2</sup>PROM values may be changed through the serial interface.
