

Virtex-6 FPGA Electrical Characteristics

Virtex®-6 FPGAs are available in -3, -2, -1, and -1L speed grades, with -3 having the highest performance. Virtex-6 FPGA DC and AC characteristics are specified in commercial, extended, industrial, and military temperature ranges. Unless noted, the Virtex-6Q FPGA DC and AC characteristics are equivalent to the commercial specifications. Except for the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing characteristics of a -1 speed grade industrial device are the same as for a -1 speed grade commercial device). However, only selected speed grades and/or devices are available in the extended, industrial, or military temperature ranges.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications.

Important Note

Typical values for quiescent supply current are specified at nominal voltage, 85°C junction temperatures (T_j). Xilinx recommends analyzing static power consumption at $T_j = 85^\circ\text{C}$ because the majority of designs operate near the high end of the commercial temperature range. Quiescent supply current is specified by speed grade for Virtex-6 devices. Use the Xilinx Power Estimator (XPE) spreadsheet tool (download at <http://www.xilinx.com/power>) to calculate static power consumption for conditions other than those specified in Table 4.

Notes:

- Typical values are specified at nominal voltage, 85°C junction temperatures (T_j). -1 and -2 industrial (I) grade devices have the same typical values as commercial (C) grade devices at 85°C, but higher values at 100°C. Use the XPE tool to calculate 100°C values. -1L industrial temperature range devices have the values specified in this column.
- Use the XPE tool to calculate 125°C values for -1M temperature range devices.
- The -2E extended temperature range (T_j = 0°C to +100°C) is only available in these devices. The -2I temperature range (T_j = -40°C to +100°C) is available for all other devices except the XC6VHX565T.
- The XC6VHX380T is available with both -2E and -2I temperature ranges.
- The XC6VHX565T is only available in the following temperature ranges: -1C, -1I, -2C, and -2E.
- The XQ6VLX130T, XQ6VLX240T, and XQ6VSX315T are available in -2I, -1I, -1M, and -1LI temperature ranges.
- The XQ6VLX550T and the XQ6VSX475T are only available in -1I and -1LI temperature ranges.
- Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
- If DCI or differential signaling is used, more accurate quiescent current estimates can be obtained by using the XPE or XPower Analyzer (XPA) tools.

Power-On Power Supply Requirements

Xilinx FPGAs require a certain amount of supply current during power-on to insure proper device initialization. The actual current consumed depends on the power-on sequence and ramp rate of the power supply.

The recommended power-on sequence for Virtex-6 devices is V_{CCINT}, V_{CCAUX}, and V_{CCO} to meet the power-up current requirements listed in Table 5. V_{CCINT} can be powered up or down at any time, but power up current specifications can vary from Table 5. The device will have no physical damage or reliability concerns if V_{CCINT}, V_{CCAUX}, and V_{CCO} sequence cannot be followed.

If the recommended power-up sequence cannot be followed and the I/Os must remain 3-stated throughout configuration, then V_{CCAUX} must be powered prior to V_{CCO} or V_{CCAUX} and V_{CCO} must be powered by the same supply. Similarly, for power-down, the reverse V_{CCAUX} and V_{CCO} sequence is recommended if the I/Os are to remain 3-stated.

The GTH transceiver supplies must be powered using a MGTHAVCC, MGTHAVCCR_X, MGTHAVCCPLL, and MGTHAVTT sequence. There are no sequencing requirement for these supplies with respect to the other FPGA supply voltages. For more detail see [Table 27: GTH Transceiver Power Supply Sequencing](#). There are no sequencing requirements for the GTX transceivers power supplies.

[Table 5](#) shows the minimum current, in addition to I_{CCQ} , that are required by Virtex-6 devices for proper power-on and configuration. If the current minimums shown in [Table 4](#) and [Table 5](#) are met, the device powers on after all three supplies have passed through their power-on reset threshold voltages. The FPGA must be configured after applying V_{CCINT} , V_{CCAUX} , and V_{CCO} for the appropriate configuration banks. Once initialized and configured, use the XPE tools to estimate current drain on these supplies.

Values for V_{IL} and V_{IH} are recommended input voltages. Values for I_{OL} and I_{OH} are guaranteed over the recommended operating conditions at the V_{OL} and V_{OH} test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum V_{CCO} with the respective V_{OL} and V_{OH} voltage levels shown. Other standards are sample tested.

Notes:

- Offset errors are removed by enabling the System Monitor automatic gain calibration feature.
- See "System Monitor Timing" in [UG370: Virtex-6 FPGA System Monitor User Guide](#)
- See "Analog Inputs" in [UG370: Virtex-6 FPGA System Monitor User Guide](#) for a detailed description.
- These internal references are not specified over the junction temperature operating range for military (M) temperature devices.
- Any variation in the reference voltage from the nominal $V_{REFP} = 1.25\text{V}$ and $V_{REFN} = 0\text{V}$ will result in a deviation from the ideal transfer function. This also impacts the accuracy of the internal sensor measurements (i.e., temperature and power supply). However, for external ratiometric type applications allowing reference to vary by $\pm 4\%$ is permitted.

This section provides the performance characteristics of some common functions and designs implemented in Virtex-6 devices. The numbers reported here are worst-case values; they have all been fully characterized. These values are subject to the same guidelines as the [Switching Characteristics, page 26](#).

1. LVDS receivers are typically bounded with certain applications where specific DPA algorithms dominate deterministic performance.
2. Verified on Xilinx memory characterization platforms designed according to the guidelines in UG: *Virtex-6 FPGA Memory Interface Solutions User Guide*.
3. Consult [DS186](#); *Virtex-6 FPGA Memory Interface Solutions Data Sheet* for performance and feature information on memory interface cores (controller plus PHY).
4. Memory Interface data rates have not been tested over the junction temperature operating range for military (M) temperature devices. Customers are responsible for specifying and testing their specific M temperature grade memory implementation.

Switching Characteristics

All values represented in this data sheet are based on these speed specifications: v1.17 for -3, -2, and -1; and v1.10 for -1L. Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

Advance

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

Preliminary

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

Production

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

All specifications are always representative of worst-case supply voltage and junction temperature conditions.

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device.

[Table 42](#) correlates the current status of each Virtex-6 device on a per speed grade basis.

Testing of Switching Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Virtex-6 devices.

Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label ([Advance](#), [Preliminary](#), [Production](#)). Any labeling discrepancies are corrected in subsequent speed specification releases.

[Table 43](#) lists the production released Virtex-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE software revisions. The ISE® software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

IOB Pad Input/Output/3-State Switching Characteristics

Table 44 (for commercial (XC) Virtex-6 devices) and **Table 45** (for the Defense-grade (XQ) Virtex-6 devices) summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

T_{IOPI} is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.

T_{IOOP} is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.

T_{IOTP} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer.

Table 46 summarizes the value of T_{IOTPHZ} . T_{IOTPHZ} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state).

Notes:

1. The input delay measurement methodology parameters for LVDCI are the same for LVC MOS standards of the same voltage. Input delay measurement methodology parameters for HSLVDCI are the same as for HSTL_II standards of the same voltage. Parameters for all other DCI standards are the same for the corresponding non-DCI standards.
2. Input waveform switches between V_L and V_H .
3. Measurements are made at typical, minimum, and maximum V_{REF} values. Reported delays reflect worst case of these measurements. V_{REF} values listed are typical.
4. Input voltage level from which measurement starts.
5. This is an input voltage reference that bears no relation to the V_{REF} / V_{MEAS} parameters found in IBIS models and/or noted in Figure 6.
6. The value given is the differential input voltage.

Output Delay Measurements

Output delays are measured using a Tektronix P6245 TDS500/600 probe (< 1 pF) across approximately 4" of FR4 microstrip trace. Standard termination was used for all testing. The propagation delay of the 4" trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in Figure 6 and Figure 7.

Figure 6: Single Ended Test Setup

ds152_07_042109

Figure 7: Differential Test Setup

Measurements and test conditions are reflected in the IBIS models except where the IBIS format precludes it. Parameters V_{REF} , R_{REF} , C_{REF} , and V_{MEAS} fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using the following method:

1. Simulate the output driver of choice into the generalized test setup, using values from Table 48.
2. Record the time to V_{MEAS} .
3. Simulate the output driver of choice into the actual PCB trace and load, using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to V_{MEAS} .
5. Compare the results of steps 2 and 4. The increase or decrease in delay yields the actual propagation delay of the PCB trace.

Notes:

1. TRACE will report all of these parameters as T_{RCKO_DO} .
2. T_{RCKO_DOR} includes T_{RCKO_DOW} , T_{RCKO_DOPR} , and T_{RCKO_DOPW} as well as the B port equivalent timing parameters.
3. These parameters also apply to synchronous FIFO with $DO_REG = 0$.
4. T_{RCKO_DO} includes T_{RCKO_DOP} as well as the B port equivalent timing parameters.
5. These parameters also apply to multirate (asynchronous) and synchronous FIFO with $DO_REG = 1$.
6. T_{RCKO_FLAGS} includes the following parameters: T_{RCKO_AEMPTY} , T_{RCKO_AFULL} , T_{RCKO_EMPTY} , T_{RCKO_FULL} , T_{RCKO_RDERR} , T_{RCKO_WRERR} .
7. $T_{RCKO_POINTERS}$ includes both $T_{RCKO_RDCOUNT}$ and $T_{RCKO_WRCOUNT}$.
8. The ADDR setup and hold must be met when EN is asserted (even when WE is deasserted). Otherwise, block RAM data corruption is possible.
9. T_{RCKO_DI} includes both A and B inputs as well as the parity inputs of A and B.
10. T_{RCO_FLAGS} includes the following flags: AEMPTY, AFULL, EMPTY, FULL, RDERR, WRERR, RDCOUNT, and WRCOUNT.
11. The FIFO reset must be asserted for at least three positive clock edges.
12. When using ISE software v12.4 or later, if the RDADDR_COLLISION_HWCONFIG attribute is set to PERFORMANCE or the block RAM is in single-port operation, then the faster F_{MAX} for WRITE_FIRST/NO_CHANGE modes apply.

Notes:

1. $T_{\text{BCCCK_CE}}$ and $T_{\text{BCCCK_S}}$ must be satisfied to assure glitch-free operation of the global clock when switching between clocks. These parameters do not apply to the BUFGMUX_VIRTEX4 primitive that assures glitch-free operation. The other global clock setup and hold times are optional; only needing to be satisfied if device operation requires simulation matches on a cycle-for-cycle basis when switching between clocks.
2. $T_{\text{BCKO_O}}$ (BUFG delay from I0 to O) values are the same as $T_{\text{BCKO_O}}$ values.

Notes:

1. When DIVCLK_DIVIDE = 3 or 4, F_{INMAX} is 315 MHz.
2. This duty cycle specification does not apply to the GTH_QUAD (GTH) to MMCM connection. The GTH transceivers drive the MMCMs at the following maximum frequencies: 323 MHz for -1 speed grade devices, 350 MHz for -2 speed grade devices, or 350 MHz for -3 speed grade devices.
3. The MMCM does not filter typical spread-spectrum input clocks because they are usually far below the bandwidth filter frequencies.
4. The static offset is measured between any MMCM outputs with identical phase.
5. Values for this parameter are available in the Clocking Wizard.
See http://www.xilinx.com/products/intellectual-property/clocking_wizard.htm.
6. Includes global clock buffer.
7. Calculated as F_{VCO}/128 assuming output duty cycle is 50%.
8. When CLKOUT4_CASCADE = TRUE, F_{OUTMIN} is 0.036 MHz.
9. In ISE software 12.3 (or earlier versions supporting the Virtex-6 family), the phase frequency detector Optimized bandwidth setting is equivalent to the High bandwidth setting. Starting with ISE software 12.4, the Optimized bandwidth setting is automatically adjusted to Low when the software can determine that the phase frequency detector input is less than 135 MHz.

Notes:

- Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
- IFF = Input Flip-Flop or Latch
- A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

Notes:

- These parameters represent the worst-case duty cycle distortion observable at the pins of the device using LVDS output buffers. For cases where other I/O standards are used, IBIS can be used to calculate any additional duty cycle distortion that might be caused by asymmetrical rise/fall times.
- The T_{CKSKEW} value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.

Updated the description for $F_{IDELAYCTRL_REF}$ in Table 53 . Updated F_{MCCK} in Table 59 .
04/01/2011	3.2	Added T_j values for C, E, and I temperature ranges to Table 2 . Updated the I_{CCQ} values in Table 4 . Updated F_{GCLK} in Table 34 . Designated the data sheet as Production for all devices not already labeled production in Table 42 . Changed the XC6VHX255T and XC6VHX565T devices in all packages to production status in Table 42 and Table 43 . This included updates to the Virtex-6 Device Pin-to-Pin Output Parameter Guidelines and Virtex-6 Device Pin-to-Pin Input Parameter Guidelines for these devices. Production speed specifications for these devices are available using the speed specification v1.14 in the ISE 13.1 software update. Updated and added package skew values to Table 72 ; these values are correct with regards to previous production released speed specifications in software. Updated copyright page 1 and Notice of Disclaimer .
12/08/2011	3.3	Production release of the Defense-grade XQ devices in Table 42 and Table 43 using ISE v13.3 v1.17 Patch for -2 and -1 speed specifications; and v1.10 for -1L speed specifications. Added the XQ6VLX130T, XQ6VLX240T, XQ6VLX550T, XQ6VSX315T, and XQ6VSX475T to the data sheet which included adding Table 45 . Updated T_j in Table 2 . In Table 40 , updated T_j for most specifications and added Note 4 . Added Note 4 to Table 41 . Added -1(XQ) speed specification columns only to Table 50 , Table 51 , Table 52 , and Table 58 . Updated V_{OD} in Table 8 , V_{OCM} in Table 9 , and V_{OCM} and V_{DIFF} in Table 10 . Updated the Power-On Power Supply Requirements section. In Table 27 , updated maximum specification for $T_{HAVCC2HAVCCRX}$ and added Note 3 . Updated T_j in Table 40 . In Table 41 , increased the DDR LVDS receiver (SPI-4.2) -1 speed grade performance value from 1.0 Gb/s to 1.1 Gb/s. In Table 60 , updated the F_{MAX} to add a separate row for the LX760 device values. The speed specifications in the software tools have always matched these values for the LX760, the data sheet is now correct. Updated the notes for $T_{OUTJITTER}$ in Table 64 .
