

AM29C116, AM29C116-1, AM29C116-2

16-Bit CMOS Microprocessors

The AM29C116 is a microprogrammable 16-bit CMOS microprocessor whose architecture and instruction set is optimized for high-performance peripheral controllers, like graphics controllers, disk controllers, communications controllers, front-end concentrators and modems. The device also performs well in microprogrammed processor applications, especially when combined with the AM29C517A, 16 x 16 Multiplier. In addition to its complete arithmetic and logic instruction set, the AM29C116 instruction set contains functions particularly useful in controller applications; bit set, bit reset, bit test, rotate-and-merge, rotate-and-compare, and cyclic-redundancy-check (CRC) generation.

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
 - Class Q Military
 - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

METALLIZATION AND PAD LAYOUT

The diagram illustrates the metallization and pad layout for a square die. The die is shown with a central core and four peripheral pad regions. The pads are labeled with various signals and power connections:

- Top Pad:** I₁, I₂, I₃, I₄, I₅, I₆, I₇, I₈, I₉, I₁₀, I₁₁, I₁₂, I₁₃, I₁₄, I₁₅, I₁₆, I₁₇, I₁₈, I₁₉, I₂₀, I₂₁, I₂₂, I₂₃, I₂₄, I₂₅, I₂₆, I₂₇, I₂₈, I₂₉, I₃₀, I₃₁, I₃₂, I₃₃, I₃₄, I₃₅, I₃₆, I₃₇, I₃₈, I₃₉, I₄₀, I₄₁, I₄₂, I₄₃, I₄₄, I₄₅, I₄₆, I₄₇, I₄₈, I₄₉, I₅₀, I₅₁, I₅₂, I₅₃, I₅₄, I₅₅, I₅₆, I₅₇, I₅₈, I₅₉, I₆₀, I₆₁, I₆₂, I₆₃, I₆₄, I₆₅, I₆₆, I₆₇, I₆₈, I₆₉, I₇₀, I₇₁, I₇₂, I₇₃, I₇₄, I₇₅, I₇₆, I₇₇, I₇₈, I₇₉, I₈₀, I₈₁, I₈₂, I₈₃, I₈₄, I₈₅, I₈₆, I₈₇, I₈₈, I₈₉, I₉₀, I₉₁, I₉₂, I₉₃, I₉₄, I₉₅, I₉₆, I₉₇, I₉₈, I₉₉, I₁₀₀, I₁₀₁, I₁₀₂, I₁₀₃, I₁₀₄, I₁₀₅, I₁₀₆, I₁₀₇, I₁₀₈, I₁₀₉, I₁₁₀, I₁₁₁, I₁₁₂, I₁₁₃, I₁₁₄, I₁₁₅, I₁₁₆, I₁₁₇, I₁₁₈, I₁₁₉, I₁₂₀, I₁₂₁, I₁₂₂, I₁₂₃, I₁₂₄, I₁₂₅, I₁₂₆, I₁₂₇, I₁₂₈, I₁₂₉, I₁₃₀, I₁₃₁, I₁₃₂, I₁₃₃, I₁₃₄, I₁₃₅, I₁₃₆, I₁₃₇, I₁₃₈, I₁₃₉, I₁₄₀, I₁₄₁, I₁₄₂, I₁₄₃, I₁₄₄, I₁₄₅, I₁₄₆, I₁₄₇, I₁₄₈, I₁₄₉, I₁₅₀, I₁₅₁, I₁₅₂, I₁₅₃, I₁₅₄, I₁₅₅, I₁₅₆, I₁₅₇, I₁₅₈, I₁₅₉, I₁₆₀, I₁₆₁, I₁₆₂, I₁₆₃, I₁₆₄, I₁₆₅, I₁₆₆, I₁₆₇, I₁₆₈, I₁₆₉, I₁₇₀, I₁₇₁, I₁₇₂, I₁₇₃, I₁₇₄, I₁₇₅, I₁₇₆, I₁₇₇, I₁₇₈, I₁₇₉, I₁₈₀, I₁₈₁, I₁₈₂, I₁₈₃, I₁₈₄, I₁₈₅, I₁₈₆, I₁₈₇, I₁₈₈, I₁₈₉, I₁₉₀, I₁₉₁, I₁₉₂, I₁₉₃, I₁₉₄, I₁₉₅, I₁₉₆, I₁₉₇, I₁₉₈, I₁₉₉, I₂₀₀, I₂₀₁, I₂₀₂, I₂₀₃, I₂₀₄, I₂₀₅, I₂₀₆, I₂₀₇, I₂₀₈, I₂₀₉, I₂₁₀, I₂₁₁, I₂₁₂, I₂₁₃, I₂₁₄, I₂₁₅, I₂₁₆, I₂₁₇, I₂₁₈, I₂₁₉, I₂₂₀, I₂₂₁, I₂₂₂, I₂₂₃, I₂₂₄, I₂₂₅, I₂₂₆, I₂₂₇, I₂₂₈, I₂₂₉, I₂₃₀, I₂₃₁, I₂₃₂, I₂₃₃, I₂₃₄, I₂₃₅, I₂₃₆, I₂₃₇, I₂₃₈, I₂₃₉, I₂₄₀, I₂₄₁, I₂₄₂, I₂₄₃, I₂₄₄, I₂₄₅, I₂₄₆, I₂₄₇, I₂₄₈, I₂₄₉, I₂₅₀, I₂₅₁, I₂₅₂, I₂₅₃, I₂₅₄, I₂₅₅, I₂₅₆, I₂₅₇, I₂₅₈, I₂₅₉, I₂₆₀, I₂₆₁, I₂₆₂, I₂₆₃, I₂₆₄, I₂₆₅, I₂₆₆, I₂₆₇, I₂₆₈, I₂₆₉, I₂₇₀, I₂₇₁, I₂₇₂, I₂₇₃, I₂₇₄, I₂₇₅, I₂₇₆, I₂₇₇, I₂₇₈, I₂₇₉, I₂₈₀, I₂₈₁, I₂₈₂, I₂₈₃, I₂₈₄, I₂₈₅, I₂₈₆, I₂₈₇, I₂₈₈, I₂₈₉, I₂₉₀, I₂₉₁, I₂₉₂, I₂₉₃, I₂₉₄, I₂₉₅, I₂₉₆, I₂₉₇, I₂₉₈, I₂₉₉, I₃₀₀, I₃₀₁, I₃₀₂, I₃₀₃, I₃₀₄, I₃₀₅, I₃₀₆, I₃₀₇, I₃₀₈, I₃₀₉, I₃₁₀, I₃₁₁, I₃₁₂, I₃₁₃, I₃₁₄, I₃₁₅, I₃₁₆, I₃₁₇, I₃₁₈, I₃₁₉, I₃₂₀, I₃₂₁, I₃₂₂, I₃₂₃, I₃₂₄, I₃₂₅, I₃₂₆, I₃₂₇, I₃₂₈, I₃₂₉, I₃₃₀, I₃₃₁, I₃₃₂, I₃₃₃, I₃₃₄, I₃₃₅, I₃₃₆, I₃₃₇, I₃₃₈, I₃₃₉, I₃₄₀, I₃₄₁, I₃₄₂, I₃₄₃, I₃₄₄, I₃₄₅, I₃₄₆, I₃₄₇, I₃₄₈, I₃₄₉, I₃₅₀, I₃₅₁, I₃₅₂, I₃₅₃, I₃₅₄, I₃₅₅, I₃₅₆, I₃₅₇, I₃₅₈, I₃₅₉, I₃₆₀, I₃₆₁, I₃₆₂, I₃₆₃, I₃₆₄, I₃₆₅, I₃₆₆, I₃₆₇, I₃₆₈, I₃₆₉, I₃₇₀, I₃₇₁, I₃₇₂, I₃₇₃, I₃₇₄, I₃₇₅, I₃₇₆, I₃₇₇, I₃₇₈, I₃₇₉, I₃₈₀, I₃₈₁, I₃₈₂, I₃₈₃, I₃₈₄, I₃₈₅, I₃₈₆, I₃₈₇, I₃₈₈, I₃₈₉, I₃₉₀, I₃₉₁, I₃₉₂, I₃₉₃, I₃₉₄, I₃₉₅, I₃₉₆, I₃₉₇, I₃₉₈, I₃₉₉, I₄₀₀, I₄₀₁, I₄₀₂, I₄₀₃, I₄₀₄, I₄₀₅, I₄₀₆, I₄₀₇, I₄₀₈, I₄₀₉, I₄₁₀, I_{411</}

ORDERING INFORMATION

Standard Products

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of:

- a. Device Number
- b. Speed Option (if applicable)
- c. Package Type
- d. Temperature Range
- e. Optional Processing

Valid Combinations	
AM29C116	PC, PCB, DC, DCB, JC
AM29C116-1	
AM29C116-2	

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, to check on newly released valid combinations, and to obtain additional data on AMD's standard military grade products.

ORDERING INFORMATION (Cont'd.)

APL Products

AMD products for Aerospace and Defense applications are available in several packages and operating ranges. APL (Approved Products List) products are fully compliant with MIL-STD-883C requirements. The order number (Valid Combination) for APL products is formed by a combination of:

- a. **Device Number**
- b. **Speed Option** (if applicable)
- c. **Device Class**
- d. **Package Type**
- e. **Lead Finish**

PIN DESCRIPTION

CP Clock Pulse (Input)

The clock input to the Am29C116. The RAM latch is transparent when the clock is HIGH. When the clock goes LOW, the RAM output is latched. Data is written into the RAM during the low period of the clock provided $\overline{IEN}$ is LOW and if the instruction being executed designates the RAM as the destination of operation. The Accumulator and Status Register will accept data on the LOW-HIGH transition of the clock if $\overline{IEN}$ is also LOW. The instruction latch becomes transparent when it exits an immediate instruction mode during a LOW-HIGH transition of the clock.

CT Conditional Test (Output)

The condition code multiplexer selects one of the twelve condition code signals and places them on the CT output. A HIGH on the CT output indicates a passed condition and a LOW indicates a failed condition.

DLE Data Latch Enable (Input)

When DLE is HIGH, the 16-bit data latch is transparent and is latched when DLE is LOW.

$\overline{IEN}$ Instruction Enable (Input)

With $\overline{IEN}$ LOW, data can be written into the RAM when the clock is LOW. The Accumulator can accept data during the LOW-HIGH transition of the clock. Having $\overline{IEN}$ LOW, the Status Register can be updated when $\overline{SRE}$ is LOW. With $\overline{IEN}$ HIGH, the conditional test output, CT, is disabled as a function of the instruction inputs. $\overline{IEN}$ should be LOW for the first half of the first cycle of an immediate instruction.

$I_0 - I_{15}$ Instruction Inputs — 16 (Input)

Used to select the operations to be performed in the Am29C116. Also used as data inputs while performing immediate instructions.

OE_T Output Enable (Input)

When OE_T is LOW, the 4-bit T outputs are disabled (high-impedance); when OE_T is HIGH, the 4-bit T outputs are enabled (HIGH or LOW).

$\overline{OE}_Y$ Output Enable (Input)

When $\overline{OE}_Y$ is HIGH, the 16-bit Y outputs are disabled (high-impedance); when $\overline{OE}_Y$ is LOW, the 16-bit Y outputs are enabled (HIGH or LOW).

$\overline{SRE}$ Status Register Enable (Input)

When $\overline{SRE}$ and $\overline{IEN}$ are both LOW, the Status Register is updated at the end of all instructions with the exception of NO-OP, Save Status, and Test Status. Having either $\overline{SRE}$ or $\overline{IEN}$ HIGH will inhibit the Status Register from changing.

$T_1 - T_4$ Input/Output Pins — 4 (Input/Output)

Under the control of OE_T , the four lower status bits Z, C, N, OVR, become outputs on $T_1 - T_4$, respectively, when OE_T goes HIGH. When OE_T is LOW, $T_1 - T_4$ are used as inputs to generate the CT output.

$Y_0 - Y_{15}$ Data I/O Lines — 16 (Input/Output)

When $\overline{OE}_Y$ is HIGH, $Y_0 - Y_{15}$ are used as external data inputs which allow data to be directly loaded into the 16-bit data latch. Having $\overline{OE}_Y$ LOW allows the ALU data to be output on $Y_0 - Y_{15}$.

FUNCTIONAL DESCRIPTION

The following diagram (Figure 2) shows a detailed block diagram of the Am29C116.

BD006540

Figure 2. Detailed Am29C116 Block Diagram

Architecture of the Am29C116

The Am29C116 is a high-performance, microprogrammable 16-bit CMOS microprocessor.

As shown in the Block Diagrams, the device consists of the following elements interconnected with 16-bit data paths.

- 32-Word by 16-Bit RAM
- Accumulator
- Data Latch
- Barrel Shifter
- ALU
- Priority Encoder
- Status Register
- Condition-Code Generator/Multiplexer
- Three-State Output Buffers
- Instruction Latch and Decoder

32-Word by 16-Bit RAM

The 32-Word by 16-Bit RAM is a single-port RAM with a 16-bit latch at its output. The latches are transparent when the clock input (CP) is HIGH and latched when the clock input is LOW. Data is written into the RAM while the clock is LOW if the $\overline{IEN}$ input is also LOW and if the instruction being executed defines the RAM as the destination of the operation. For byte instructions, only the lower eight RAM bits are written into; for word instructions, all 16 bits are written into. With the use of an external multiplexer on five of the instruction inputs, it is possible to select separate read and write addresses for the same instruction. This two-address operation is not allowed for immediate instructions.

Accumulator

The 16-bit Accumulator is an edge-triggered register. The Accumulator accepts data on the LOW-to-HIGH transition of the clock input if the $\overline{IEN}$ input is LOW and if the instruction being executed defines the Accumulator as the destination of the operation. For byte instructions, only the lower eight bits of the Accumulator are written into; for word instructions, all 16 bits are written into.

Data Latch

The 16-bit Data Latch holds the data input to the Am29C116 on the bi-directional Y bus. The latch is transparent when the DLE input is HIGH and latched when the DLE input is LOW.

Barrel Shifter

A 16-bit Barrel Shifter is used as one of the ALU inputs. This permits rotating data from either the RAM, the Accumulator or the Data Latch up to 15 positions. In the word mode, the Barrel Shifter rotates a 16-bit word; in the byte mode, it rotates only the lower eight bits.

Arithmetic Logic Unit

The Am29C116 contains a 16-bit ALU with full carry lookahead across all 16 bits in the arithmetic mode. The ALU is capable of operating on either one, two or three operands, depending upon the instruction being executed. It has the ability to execute all conventional one and two operand operations, such as pass, complement, two's complement, add, subtract, AND, NAND, OR, NOR, EXOR, and EX-NOR. In addition, the ALU can also execute three-operand instructions such as rotate and merge and rotate and compare with mask. All ALU operations can be performed on either a word or byte basis, byte operations being performed on the lower eight bits only.

The ALU produces three status outputs, C (carry), N (negative) and OVR (overflow). The appropriate flags are generated at the byte or word level, depending upon whether the device is executing in the byte or word mode. The Z (zero) flag,

although not generated by the ALU, detects zero at both the byte and word level.

The carry input to the ALU is generated by the Carry Multiplexer which can select an input of zero, one, or the stored carry bit from the Status Register, QC. Using QC as the carry input allows execution of multiprecision addition and subtractions.

Priority Encoder

The Priority Encoder produces a binary-weighted code to indicate the locations of the highest order ONE at its input. The input to the Priority Encoder is generated by the ALU which performs an AND operation on the operand to be prioritized and a mask. The mask determines which bit locations to eliminate from prioritization. In the word mode, if no bit is HIGH, the output is a binary zero. If bit 15 is HIGH, the output is a binary one. Bit 14 produces a binary two, etc. Finally, if only bit 0 is HIGH, a binary 16 is produced.

In the byte mode, bits 8 thru 15 do not participate. If none of bits 7 thru 0 are HIGH, the output is a binary zero. If bit 7 is HIGH a binary one is produced. Bit 6 produces a binary two, etc. Finally, if only bit 0 is HIGH, a binary 8 is produced.

Status Register

The Status Register holds the 8-bit status word. With the Status-Register Enable, ($\overline{SRE}$) input LOW and the $\overline{IEN}$ input LOW, the Status Register is updated at the end of all instructions except NO-OP, Save-Status and Test-Status instructions. $\overline{SRE}$ going HIGH or $\overline{IEN}$ going HIGH inhibits the Status Register from changing.

The lower four bits of the Status Register contain the ALU status bits of Zero (Z), Carry (C), Negative (N), and Overflow (OVR). The upper four bits contain a Link bit and three user-definable status bits (Flag 1, Flag 2, Flag 3).

With $\overline{SRE}$ LOW and $\overline{IEN}$ LOW, the lower four status bits are updated after each instruction except those mentioned above, NO-OP, Save Status, Status Test and the Status Set/Reset instruction for the upper four bits. Under the same conditions, the upper four status bits are changed only during their respective Status Set/Reset instructions and during Status Load instructions in the word mode. The Link-Status bit is also updated after each shift instruction.

The Status Register can be loaded from the internal Y-bus, and can also be selected as a source for the internal Y-bus. When the Status Register is loaded in the word mode, all 8-bits are updated; in the byte mode, only the lower 4 bits (Z, C, N, OVR) are updated.

When the Status Register is selected as a source in the word mode, all eight bits are loaded into the lower byte of the destination; the upper byte of the destination is loaded with all zeros. In the byte mode, the Status Register again loads into the lower byte of the destination, but the upper byte remains unchanged. This Store and Load combination allows saving and restoring the Status Register for interrupt and subroutine processing. The four lower status bits (Z, C, N, OVR) can be read directly via the bidirectional T bus. These four bits are available as outputs on the T_{1-4} outputs whenever OE_T is HIGH.

Condition-Code Generator/Multiplexer

The Condition-Code Generator/Multiplexer contains the logic necessary to develop the 12 condition-code test signals. The multiplexer portion can select one of these test signals and place it on the CT output for use by the microprogram sequence. The multiplexer may be addressed in two different ways. One way is through the Test Instruction. This instruction specifies the test condition to be placed in the CT output, but

does not allow an ALU operation at the same time. The second method uses the bidirectional T bus as an input. This requires extra bits in the microword, but provides the ability to simultaneously test and execute. The test instruction lines, I₀₋₄, have priority over T₁₋₄, for testing status.

Three-State Output Buffers

There are two sets of Three-State Output Buffers in the Am29C116. One set controls the bidirectional, 16-bit Y bus. These outputs are enabled by placing a LOW on the $\overline{OE}$ input. A HIGH puts the Y outputs in the high-impedance state, allowing data to be input to the Data latch from an external source.

The second set of Three-State Output Buffers controls the bidirectional 4-bit T bus and is enabled by placing a HIGH on the OE_T input. This allows storing the four internal ALU status bits (Z, C, N, OVR) externally. A LOW OE_T input forces the T outputs into the high-impedance state. External devices can

then drive the T bus to select a test condition for the CT output.

Instruction Latch and Decoder

The 16-bit Instruction Latch is normally transparent to allow decoding of the Instruction Inputs by the Instruction Decoder into the internal control signals for the Am29C116. All instructions except Immediate Instructions are executed in a single clock cycle.

Immediate instructions require two clock cycles for execution. During the first clock cycle, the Instruction Decoder recognizes that an Immediate Instruction is being specified and captures the data on the Instruction Inputs in the Instruction Latch. During the second clock cycle, the data on the Instruction Inputs is used as one of the operands for the function specified during the first clock cycle. At the end of the second clock cycle, the Instruction Latch is returned to its transparent state.

Instruction Set

The instruction set of the Am29C116 is very powerful. In addition to the single and two operand logical and arithmetic instructions, the Am29C116 instruction set contains functions particularly useful in controller applications: bit set, bit reset, bit test, rotate and merge, rotate and compare, and cyclic-redundancy-check (CRC) generation. Complex instructions like rotate and merge, rotate and compare, and prioritize are executed in a single microcycle.

Three data types are supported by the Am29C116.

- Bit
- Byte
- Word (16-bit)

In the byte mode, data is written into the lower half of the word and the upper half is unchanged. The special case is when the status register is specified as the destination. In the byte mode, the LSH (OVR, N, C, Z) of the status register is updated and in the word mode all eight bits of the status register are updated. The status register does not change for save status and test status instructions. In the test status instructions, the CT output has the result and the Y-bus is undefined.

The Am29C116 Instruction Set can be divided into eleven types of instructions. These are:

- | | |
|--------------------|---------------------------|
| • Single Operand | • Rotate and Compare |
| • Two Operand | • Prioritize |
| • Single Bit Shift | • Cyclic-Redundancy-Check |
| • Rotate and Merge | • Status |
| • Bit Oriented | • No-Op |
| • Rotate by n Bits | |

Each instruction type is arbitrarily divided into quadrants. Two of the sixteen instruction lines decode to four quadrants labelled from 0 to 3. The quadrants were defined mainly for convenience in classification of the instruction set and addressing modes and can be used together with the OP CODES to distinguish the instructions.

The following pages describe each of the instruction types in detail. Throughout the description $\overline{OE}_Y$ is assumed to be LOW allowing ALU outputs on the Y-bus.

Table 1 illustrates operand source-destination combinations for each instruction type.

TABLE 1. OPERAND SOURCE DESTINATION COMBINATIONS

Instruction Type	Operand Combinations (Note 1)	
	Source (R/S)	Destination

Test Status			

- Notes: 1. When there is no dividing line between the R&S OPERAND or SOURCE and DESTINATION, the two must be used as a given pair. But where there exists such a separation, any combination of them is possible.
2. In the SINGLE OPERAND INSTRUCTION, RAM cannot be used when both ACC and STATUS are designated as a DESTINATION.
3. In the PRIORITIZE INSTRUCTION, OPERAND and MASK must be different sources.

SINGLE OPERAND INSTRUCTIONS

The Single Operand Instructions contain four indicators: byte or word mode, opcode, source and destination. They are further subdivided into two types. The first type uses RAM as a source or destination or both, and the second type does not use RAM as a source or destination. Both types have different instruction formats as shown below. Under the control of instruction inputs, the desired function is performed on the source and the result is either stored in the specified destination or placed on the Y-bus or both. For a special case where

8-bit to 16-bit conversion is needed, the Am29C116 is capable of extending sign bit (D(SE)) or binary zero (D(0E)) over 16-bits in the word mode. The least significant four bits of the Status Register (OVR, N, C, Z) are affected by the function performed in this category. The most significant bits of status register (FLAG1, FLAG2, FLAG3, LINK) are not affected. The only limitation in this type is that the RAM cannot be used as a source when both ACC and the Status Register are specified as a destination.

TWO OPERAND INSTRUCTIONS

The Two Operand Instructions contain five indicators: byte or word mode, opcode, R source, S source, and destination. They are further subdivided into two types. The first type uses RAM as the source and/or destination and the second type does not use RAM as source or destination. The first type has two formats; the only difference is in the quadrant. Under the control of instruction inputs, the desired function is performed on the specified sources and the result is stored in the

specified destination or placed on the Y-bus or both. The least significant four bits of the status register (OVR, N, C, Z) are affected by the arithmetic functions performed and only the N and Z bits are affected by the logical functions performed. The OVR and C bits of the status register are forced to ZERO for logical functions. Add with carry and Subtract with carry instructions are useful for Multiprecision Add or Subtract.

SINGLE BIT SHIFT INSTRUCTIONS

The Single Bit Shift Instructions contain four indicators: byte or word mode, direction and shift linkage, source and destination. They are further subdivided into two types. The first type uses RAM as the source and/or destination and the second type does not use RAM as source or destination. Under the control of the instruction inputs, the desired shift function is performed on the specified source and the result is stored in the specified destination or placed on the Y-bus or both. The direction and shift linkage indicator defines the direction of the shift (up or down) as well as what will be shifted into the vacant bit. On a shift-up instruction, the LSB may be loaded with ZERO, ONE,

or the Link-Status bit (QLINK). The MSB is loaded into the Link-Status bit as shown in Figure 3. On a shift-down instruction, the MSB may be loaded with ZERO, ONE, the contents of the Status Carry flip-flop, (QC), the Exclusive-OR of the Negative-Status bit and the Overflow-Status bit ($QN \oplus QOVR$) or the Link-Status bit. The LSB is loaded into the Link-Status bit as shown in Figure 4. The N and Z bits of the Status register are affected but the OVR and C bits are forced to ZERO. The Shift-Down with $QN \oplus QOVR$ is useful for Two's Complement multiplication.

BIT ORIENTED INSTRUCTIONS

The Bit Oriented Instructions contain four indicators: byte or word mode, operation, source/destination, and the bit position of the bit to be operated on (Bit 0 is the least significant bit). They are further subdivided into two types. The first type uses the RAM as both source and destination and has two kinds of formats which differ only by quadrant. The second type does not use the RAM as a source or a destination. Under the control of the instruction inputs, the desired function is performed on the specified source and the result is stored in the specified destination or placed on the Y-bus or both. The operations which can be performed are: Set Bit n which forces the n^{th} bit to a ONE leaving other bits unchanged; Reset Bit n

which forces the n^{th} bit to ZERO leaving the other bits unchanged; Test Bit n , which sets the ZERO Status Bit depending on the state of bit n leaving all the bits unchanged; Load 2^n , which loads ONE in Bit position n and ZERO in all other bit positions; Load 2^n which loads ZERO in bit position n and ONE in all other bit positions; increment by 2^n , which adds 2^n to the operand; and decrement by 2^n which subtracts 2^n from the operand. For all the Load, Set, Reset and Test instructions, the N and Z bits are affected and OVR and C bit of the Status register are forced to ZERO. For all arithmetic instructions the LSH (OVR, C, N, Z bits) of the Status register is affected.

ROTATE BY n BITS INSTRUCTIONS

The Rotate by n Bits Instructions contain four indicators: byte or word mode, source, destination and the number of places the source is to be rotated. They are further subdivided into two types. The first type uses RAM as a source and/or a destination and the second type does not use RAM as a source or destination. The first type has two different formats and the only difference is in the quadrant. The second type has only one format as shown in the table. Under the control of instruction inputs, the n indicator specifies the number of bit positions the source is to be rotated up (0 to 15), and the result

is either stored in the specified destination or placed on the Y bus or both. An example of this instruction is given in Figure 5. In the Word mode, all 16-bits are rotated up; while in the Byte mode, only the lower 8-bits (0-7) are rotated up. In the Word mode, a rotate up by n bits is equivalent to a rotate down by (16-n) bits. Similarly, in the Byte mode a rotate up by n bits is equivalent to a rotate down by (8-n) bits. The N and Z bits of the Status Register are affected and OVR and C bits are forced to ZERO.

ROTATE AND MERGE INSTRUCTION

The Rotate and Merge Instructions contain five indicators: byte or word mode, rotated source, non-rotated source/destination, mask and the number of bit positions a source is to be rotated. The function performed by the Rotate and Merge instruction is illustrated in Figure 6. The rotated source, U, is rotated up by the Barrel Shifter n places. The mask input then selects, on a bit by bit basis, the rotated U input or R

input. A ZERO in bit i of the mask will select the i^{th} bit of the R input as the i^{th} output bit, while ONE in bit i will select the i^{th} rotated U input as the output bit. The output word is stored in the non-rotated operand location. The N and Z bits are affected. The OVR and C bits of the Status register are forced to ZERO. An example of this instruction is given in Figure 7.

ROTATE AND COMPARE INSTRUCTIONS

The Rotate and Compare Instructions contain five indicators: byte or word mode, rotated source, non-rotated source, mask, and the number of bit positions the rotated source is to be rotated up. Under the control of instruction inputs, the function performed by the Rotate and Compare instruction is illustrated in Figure 8. The rotated operand is rotated by the Barrel Shifter n places. The mask is inverted and ANDed on a bit-by-bit basis

with the output of the Barrel Shifter and R input. Thus, a ONE in the mask input eliminates that bit from the comparison. A ZERO allows the comparison. If the comparison passes, the Zero flag is set. If it fails, the Zero flag is reset. The N and Z bit are affected. The OVR and C bits of the Status register are forced to ZERO. An example of this instruction is given in Figure 9.

PRIORITIZE INSTRUCTION

The Prioritize Instructions contain four indicators: byte or word mode, operand source (R), mask source (S) and destination. They are further subdivided into two types. The function performed by the Prioritize instruction is shown in Figure 10. The R operand is ANDed with the complement of the Mask operand. A ZERO in the Mask operand allows the corresponding bit in the R operand to participate in the priority encoding function. A ONE in the Mask operand forces the corresponding bit in the R operand to a ZERO, eliminating it from participation in the priority encoding function.

Figure 10. Prioritize Function

The priority encoder accepts a 16-bit input and produces a 5-bit binary-weighted code indicating the bit position of the highest priority active bit. If none of the inputs are active, the output is ZERO. In the Word mode, if input bit 15 is active, the output is 1, etc. Figure 11 lists the output as a function of the highest-priority active-bit position in both the Word and Byte mode. The N and Z bits are affected and the OVR and C bits of the status register are forced to ZERO. The only limitation in this instruction is that the operand and the mask must be different sources.

CRC INSTRUCTION

The CRC (Cyclic-Redundancy-Check) Instructions contain one indicator: address of a RAM register to use as the check sum register. The CRC instruction provides a method for generation of the check bits in a CRC calculation. Two CRC instructions are provided – CRC Forward and CRC Reverse. The reason for providing two instructions is that CRC standards do not specify which data bit is to be transmitted first, the LSB or the MSB, but they do specify which check bit must be transmitted first. Figure 12 illustrates the method used to generate these check bits for the CRC Forward function and

Figure 13 illustrates method used for the 2CRC Reverse function. The ACC serves as a polynomial mask to define the generating polynomial while the RAM register holds the partial result and eventually the calculated check sum. The LINK-bit is used as the serial input. The serial input combines with the MSB of the check-sum register, according to the polynomial defined by the polynomial mask register. When the last input bit has been processed, the check-sum register contains the CRC check bits. The LINK, N and Z bits are affected and the OVR and C bits of the Status register are forced to ZERO.

STATUS INSTRUCTIONS

Status Instructions – The Set Status Instruction contains a single indicator. This indicator specifies which bit or group of bits, contained in the status register (Figure 14), are to be set (forced to a ONE).

7	6	5	4	3	2	1	0
Flag3	Flag2	Flag1	LINK	OVR	N	C	Z

MPR-775

Figure 14. Status Byte

The Reset Status Instruction contains a single indicator. This indicator specifies which bit or group of bits, contained in the status register, are to be reset (forced to ZERO).

The Store Status Instruction contains two indicators; byte/word and a second indicator that specifies the destination of the status register. The Store Status Instruction allows the status of the processor to be saved and restored later, which is an especially useful function for interrupt handling.

The status register is always stored in the lower byte of the RAM or the ACC register. Depending upon byte or word mode the upper byte is unchanged or loaded with all ZEROS respectively.

The Load Status instructions are included in the single operand and two operand instruction types.

The Test Status Instructions contain a single indicator which specifies which one of the 12 possible test conditions are to be placed on the Conditional-Test output. Besides the eight bits in the Status register (QZ, QC, QN, QOVR, QLINK, QFlag1, QFlag 2, and QFlag3), four logical functions (QN $\oplus$ QOVR), (QN $\oplus$ QOVR) + QZ, QZ + $\overline{QC}$ and LOW may also be selected. These functions are useful in testing results of Two's Complement and unsigned number arithmetic operations. The status register may also be tested via the bidirectional T bus. The code to test the status register via T bus is similar to the code used by instruction lines I₁ to I₄ as shown below. Instruction lines I₀ – 4 have priority over T bus for testing the

status register on CT output. See the discussion on the status register for a full description.

T ₄ I ₄	T ₃ I ₃	T ₂ I ₂	T ₁ I ₁	CT
0	0	0	0	(N $\oplus$ OVR) + Z

	RALU	(29C116)	I-Y	79	65	57
	Data Register		Setup	4	4	4
	Cycle Time:			110 ns	96 ns	88 ns

The Use of an External Status Register in Reducing Microcycle Length

The standard connection of the CT pin of the Am29C116 and microcycle length calculation arising from that connection are shown below:

CRITICAL PATH TIMING (FIGURE 16-1)

Part Number	Path	Maximum Commercial Delay (ns)
Pipeline Register	CP-Q	12
Am29C116-2	I, T-CT	25
CC-MUX	D-W	7
Am29C10A-1	CC-Y	26
Control Memory	IAA	40
Pipeline Register	Setup	4
		114

While 114-ns cycle time is quite fast, it can be improved by using an external register for status testing.

CRITICAL PATH TIMING (FIGURE 16-2)

Part Number	Path	Maximum Commercial Delay (ns)
Status Reg	CP-Y	12
CC-MUX	Set-W	15
Am29C10A-1	CC-Y	26
Control Memory	IAA	40
Pipeline Register	Setup	4
		97

The cycle time has been reduced from 114 ns to 97 ns.

Figure 16-1.

Figure 16-2.

 (Case) Temperature Under Bias -55 to +125°C
 Supply Voltage to
 Ground Potential Continuous -0.3 V to +7.0 V
 DC Voltage Applied to Outputs For
 High Output State -0.3 V to +V_{CC} +0.3 V
 DC Input Voltage -0.3 V to +V_{CC} +0.3 V
 DC Output Current, Into LOW Outputs 30 mA
 DC Input Current -10 mA to +10 mA

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

DC CHARACTERISTICS over operating ranges unless otherwise specified (for APL Products, Group A, Subgroups 1, 2, 3 are tested unless otherwise noted)

OPERATING RANGES

Commercial (C) Devices
 Ambient Temperature (T_A) 0 to +70°C
 Supply Voltage (V_{CC}) +4.5 V to +5.5 V

Military* (M) Devices
 Ambient Temperature (T_A) -55 to +125°C
 Supply Voltage (V_{CC}) +4.5 V to +5.5 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

*Military Product 100% tested at T_A = +25°C, +125°C, and -55°C.

Parameter Symbol	Parameter Description	Test Conditions (Note 1)		Min.	Max.	Unit
V _{OH}	Output HIGH Voltage	V _{CC} = Min. V _{IN} = V _{IH} or V _{IL}	I _{OH} = -1.6 mA/-1.2 mA (COM'L/MIL)	2.4		V
V _{OL}	Output LOW Voltage	V _{CC} = Min. V _{IN} = V _{IH} or V _{IL}	I _{OL} = 16 mA/12 mA (COM'L/MIL)		0.5	V
V _{IH}	Guaranteed Input Logical HIGH Voltage (Note 2)			2.0		V
V _{IL}	Guaranteed Input Logical LOW Voltage (Note 2)				0.8	V
I _{IL}	Input LOW Current	V _{CC} = Max. V _{IN} = 0.5 Volts			-10	μA
I _{IH}	Input HIGH Current	V _{CC} = Max. V _{IN} = V _{CC} - 0.5 V			10	μA
I _{OZH}	Off State (HIGH Impedance) Output Current	V _{CC} = Max. V _O = 2.4 Volts			10	μA
I _{OZL}	Off State (HIGH Impedance) Output Current	V _{CC} = Max. V _O = 0.5 Volts			-10	μA
I _{CC}	Static Power Supply Current (Note 3)	V _{CC} = Max. I _O = 0 μA	COM'L T _A = 0 to +70°C	(Note 4) CMOS V _{IN} = V _{CC} or GND	120	mA
				(Note 4) TTL V _{IN} = 0.5 V or 2.4 V	170	
			MIL T _A = -55 to +125°C	(Note 4) CMOS V _{IN} = V _{CC} or GND	145	
				(Note 4) TTL V _{IN} = 0.5 V or 2.4 V	200	
C _{PD}	Power Dissipation Capacitance (Note 5)	V _{CC} = 5.0 V T _A = 25°C No Load			850 pF Typical	

Notes: 1. V_{CC} conditions shown as Min. or Max. refer to ±10% V_{CC} limits.
 2. These input levels provide zero-noise immunity and should only be statically tested in a noise-free environment (not functionally tested).
 3. Worst-case I_{CC} is measured at the lowest temperature in the specified operating range.
 4. Use CMOS I_{CC} when the device is driven by CMOS circuits and TTL I_{CC} when the device is driven by TTL circuits.
 5. C_{PD} determines the dynamic current consumption:

$$I_{CC} \text{ (Total)} = I_{CC} \text{ (Static)} + (C_{PD} + nCL) \frac{f}{2}$$
 where f is the clock frequency, CL output load capacitance, and n number of loads.

SWITCHING CHARACTERISTICS over **COMMERCIAL** operating range unless otherwise specified
($T_A = 0$ to $+70^\circ\text{C}$, $V_{CC} = 4.5$ to 5.5 V, $C_L = 50$ pF)

Test Philosophy and Methods

The following points give the general philosophy that we apply to tests that must be properly engineered if they are to be implemented in an automatic environment. The specifics of what philosophies applied to which test are shown in the data sheet.

1. Ensure the part is adequately decoupled at the test head. Large changes in V_{CC} current as the device switches may cause erroneous function failures due to V_{CC} changes.
2. Do not leave inputs floating during any tests, as they may start to oscillate at high frequency.
3. Do not attempt to perform threshold tests at high speed. Following an output transition, ground current may change by as much as 400 mA in 5-8 ns. Inductance in the ground cable may allow the ground pin at the device to rise by hundreds of millivolts momentarily. Current level may vary from product to product.
4. Use extreme care in defining input levels for AC tests. Many inputs may be changed at once, so there will be significant noise at the device pins that may not actually reach V_{IL} or V_{IH} until the noise has settled. AMD recommends using $V_{IL} \leq 0$ V and $V_{IH} \geq 3.0$ V for AC tests.
5. To simplify failure analysis, programs should be designed to perform DC, Function, and AC tests as three distinct groups of tests.
6. Capacitive Loading for AC Testing

Automatic testers and their associated hardware have stray capacitance that varies from one type of tester to another but is generally around 50 pF. This makes it impossible to make direct measurements of parameters that call for a smaller capacitive load than the associated stray capacitance. Typical examples of this are the so-called "float delays," which measure the propagation delays into the high-impedance state and are usually specified at a load capacitance of 5.0 pF. In these cases, the test is performed at the higher load capacitance (typically 50 pF), and engineering correlations based on data taken with a bench set up are used to predict the result at the lower capacitance.

Similarly, a product may be specified at more than one capacitive load. Since the typical automatic tester is not capable of switching loads in mid-test, it is impossible to make measurements at both capacitances even though they may both be greater than the stray capacitance. In these cases, a measurement is made at one of the two capacitances. The result at the other capacitance is predicted from engineering correlations based on data taken with a bench setup and the knowledge that certain DC measurements (I_{OH} , I_{OL} , for example) have already been taken and are within specification. In some cases, special DC tests are performed in order to facilitate this correlation.

7. Threshold Testing

The noise associated with automatic testing (due to the long inductive cables), and the high gain of the tested device when in the vicinity of the actual device threshold, frequently give rise to oscillations when testing high-speed circuits. These oscillations are not indicative of a reject device, but instead, of an overtaxed test system. To minimize this problem, thresholds are tested at least once for each input pin. Thereafter, "hard" high and low levels are used for other tests. Generally this means that function and AC testing are performed at "hard" input levels rather than at V_{IL} Max. and V_{IH} Min.

8. AC Testing

Occasionally parameters are specified that cannot be measured directly on automatic testers because of tester limitations. Data input hold times often fall into this category. In these cases, the parameter in question is guaranteed by correlating these tests with other AC tests that have been performed. These correlations are arrived at by the cognizant engineer using data from precise bench measurements in conjunction with the knowledge that certain DC parameters have already been measured and are within spec.

In some cases, certain AC tests are redundant since they can be shown to be predicted by other tests that have already been performed. In these cases, the redundant tests are not performed.
