

## Low-Jitter I<sup>2</sup>C/SPI Programmable CMOS Oscillator

### General Description

The DSC2110 and DSC2210 series of programmable, high-performance CMOS oscillators utilize a proven silicon MEMS technology to provide excellent jitter and stability while incorporating high output frequency flexibility and drive strength control. DSC2110 and DSC2210 allow the user to modify the frequency and CMOS drive strength using I<sup>2</sup>C or SPI interface, respectively. User can also select from two pre-programmed default output frequencies using the control pin.

DSC2110 and DSC2210 are packaged in 14-pin 3.2x2.5 mm QFN packages and available in temperature grades from Ext. Commercial to Automotive.

### Features

- **Low RMS Phase Jitter: <1 ps (typ)**
- **High Stability: ±10, ±25, ±50 ppm**
- **Wide Temperature Range**
  - Automotive: -55° to 125° C
  - Ext. Industrial: -40° to 105° C
  - Industrial: -40° to 85° C
  - Ext. commercial: -20° to 70° C
- **High Supply Noise Rejection: -50 dBc**
- **I<sup>2</sup>C/SPI Programmable Freq & Drive**
- **Short Lead Times: 2 Weeks**
- **Wide Freq. Range:**
  - CMOS Output: 2.3 to 170 MHz
- **Miniature Footprint of 3.2x2.5mm**
- **Excellent Shock & Vibration Immunity**
  - Qualified to MIL-STD-883
- **High Reliability**
  - 20x better MTF than quartz oscillators
- **Supply Range of 2.25 to 3.6 V**
- **Lead Free & RoHS Compliant**

### Applications

- **Consumer Electronics**
- **Storage Area Networks**
  - SATA, SAS, Fibre Channel
- **Passive Optical Networks**
  - EPON, 10G-EPON, GPON, 10G-PON
- **Ethernet**
  - 1G, 10GBASE-T/KR/LR/SR, and FCoE
- **HD/SD/SDI Video & Surveillance**
- **PCI Express**

## Operational Description

The DSC2110/2210 is a CMOS oscillator consisting of a MEMS resonator and a support PLL IC. The CMOS output is generated through independent 8-bit programmable dividers from the output of the internal PLL.

DSC2110/2210 allows for easy programming of the output frequencies using I<sup>2</sup>C/SPI interface. Upon power-up, the initial output frequency is controlled by an internal pre-programmed memory (OTP). This memory stores all coefficients required by the PLL for two different default frequencies. The control pin (FS) selects the initial frequency. Once the device is powered up, a new output frequency can be programmed. Programming details are provided in the **Programming Guide**. Standard default frequencies are described in the following sections. Discera supports customer defined versions of the DSC2110/2210.

When Enable (pin 1) is floated or connected to VDD, the DSC2110/2210 is in operational

mode. Driving Enable to ground will disable both output drivers (hi-impedance mode).

The DSC2110/2210 has programmable output drive strength, which can be controlled via I<sup>2</sup>C/SPI. Table 1 displays typical rise / fall times for the output with a 15pf load capacitance as a function of these control bits at VDD=3.3V and room temperature.

Table 1. Rise/Fall times for drive strengths

Output Drive Strength Bits [OXS2, OXS1, OXS0] - Default <b>[111]</b> X=1 for output1, and 2 for output2

## Output Clock Frequencies

Table 2 lists the standard frequency configurations and the associated ordering information to be used in conjunction with the ordering code. Customer defined combinations are available.

Frequency select bit are weakly tied high so if left unconnected the default setting will be [1] and the device will output the associated frequency highlighted in **Bold**.
